1 **Abstract:**

2 **Objective:** To assess the educational needs of people with Ankylosing Spondylitis (AS)
3 and Psoriatic Arthritis (PsA), test differences across patient subgroups and identify factors
4 independently associated with their educational needs.

5 **Methods:** This was a cross-sectional analytic study. Patients with AS and PsA completed
6 the Portuguese version of the Educational Needs Assessment Tool (PortENAT). Data
7 were Rasch-transformed before descriptive and inferential analyses were undertaken.
8 Univariable and multivariable analyses were used to determine differences between
9 patient subgroups and factors independently associated with their educational needs.

10 **Results:** The study included 121 patients with AS and 132 with PsA. The level of
11 educational needs varied by diagnostic group, but higher needs for both subgroups were
12 reported regarding the “Disease process”, “Feelings” and “Managing pain” domains.
13 Overall, patients with AS had a higher level of educational needs than those with PsA. In
14 both disease groups, female gender was independently associated with higher educational
15 needs. In the PsA group, a shorter disease duration was independently associated with
16 higher educational needs in the following domains: “Managing pain”, “Movement” and
17 “Feelings”.

18 **Conclusion:** Educational needs vary by diagnostic group, gender and disease duration.
19 These differences merit consideration in the design of patient education interventions.

20

21 **Key words:** educational needs assessment, patient education, spondyloarthritis,
22 ankylosing spondylitis, psoriatic arthritis.

25

1 **Introduction**

2 Ankylosing Spondylitis (AS) and Psoriatic Arthritis (PsA) have important and
3 multidimensional impacts upon patient's lives, derived not only from pain, joint
4 deformity and work disability but also due to interference in simple daily activities, such
5 as self-care (1–3). The holistic management of these conditions involves pharmacological
6 (4,5) and non-pharmacological interventions such as healthy lifestyle choices (e.g.
7 smoking cessation, weight management and diet), physiotherapy and exercise (4,6,7).
8 Patients and health-care professionals have stressed the need for personalisation of
9 treatment according to individual needs, values and resources. Patient education plays a
10 crucial role in empowering patients as partners in achieving the desirable standards of
11 care (8).

12 The Educational Needs Assessment Tool was developed in the UK (9) and later
13 adapted and validated into Portuguese (PortENAT) (10) and other languages for use in
14 seven rheumatic diseases, including AS and PsA (11). The clinical utility of this tool has
15 been evaluated by patients and clinicians (12) and it has been shown to help deliver
16 effective needs-based patient education in rheumatoid arthritis (RA) (13).

17 Three studies have summarised the educational needs of patients with
18 Spondyloarthritis (SpA) (14–16). Two (14,15) were conducted in Sweden and one in
19 Austria (16). One (14) found that patients with SpA (AS and undifferentiated
20 Spondyloarthritis - USpA) had considerable educational needs, especially concerning
21 “Self-help”, “Feelings”, and the “Disease process”; and the other (15) validated ENAT to
22 assess educational needs in USpA, and showed that higher disease activity was associated
23 with higher levels of educational needs. The Austrian study (16), showed that educational
24 needs vary by diagnostic group (PsA, RA, and osteoarthritis), disease activity and
25 personal characteristics. The results of the above studies are interesting but may not be

1 generalizable to other countries, due to differences in culture, healthcare systems and the
2 way patient education is delivered. In addition, none of them assessed the factors
3 independently associated with educational needs, using multivariable analyses.

4 The objectives of this study were to (i) assess the self-reported educational needs
5 of patients with AS and PsA, (ii) study the differences between patient subgroups and (iii)
6 identify factors independently associated with educational needs in patients with these
7 conditions.

8

9 **Materials and methods**

10 *Study design and settings*

11 This was a cross-sectional study carried out in an outpatient clinic of a university hospital
12 in the centre region of Portugal. The study was conducted in accordance with the
13 declaration of Helsinki and was approved by the local ethics committee (HUC-09-010).
14 Voluntary informed consent was obtained from all patients prior to any study procedures.

15

16 *Participants*

17 Consecutive patients from the rheumatology clinics meeting the following inclusion
18 criteria were invited to participate: (i) age \geq 18 years old, (ii) a clinical diagnosis of AS
19 or PsA by a rheumatologist, and (iii) ability to complete the questionnaire unaided. The
20 exclusion criteria were (i) having any other clinically significant comorbid rheumatic
21 disease, (ii) unwillingness to participate.

22

23 *Assessments*

24 All participants completed the PortENAT in its original form, i.e., the Portuguese
25 version of ENAT used for European validation of this tool (10). This questionnaire

1 contains 39 items, grouped into 7 domains: “Managing pain” (7 items), “Movement” (5
2 items), “Feelings” (4 items), “Disease process” (7 items), “Treatments” (7 items), “Self-
3 help measures” (6 items), and “Support systems” (4 items). Each item is assessed using a
4 0-4 Likert Scale from “not at all important” to “extremely important”. This gives a total
5 score range of 0 to 156, higher scores representing higher educational needs.

6 From the first page of PortENAT we collected patient-reported information about
7 personal characteristics (age, gender, disease duration (years) and educational
8 background (three ordinal options: basic, secondary or higher)) plus an indication of their
9 overall needs for information about their rheumatic disease (four ordinal options from “I
10 do not want to know anything” to “I want to know everything”). Further details of the
11 PortENAT and its validation can be found elsewhere (10). Patients completed the
12 PortENAT before a regular clinic appointment.

13

14 *Data Analysis*

15 Following completion of the PortENAT, the raw scores were transformed into
16 interval-level data (ordinal-to-interval measure conversion table is published elsewhere
17 (10)) and summarised descriptively before further analyses. As the ENAT domains have
18 different maximum scores, mean percentages of the maximum score were determined and
19 used to compare between domains.

20 For univariable analyses, we used independent t-tests to evaluate differences in
21 educational needs between gender (female vs male) and educational background (patients
22 with “basic education” vs those with “secondary or higher education”). To investigate the
23 relationship between educational needs and the independent continuous variables (age
24 and disease duration) correlation statistics were used.

1 Multivariable analyses (multiple linear regression, enter method) were performed
2 for each disease, using PortENAT scores (domain and total scores) as dependent variables
3 and forcing age (years, continuous), gender (female vs male), educational background
4 (“basic education” vs “secondary or higher education”) and disease duration (years,
5 continuous) in the model as theoretically important independent variables.

6 We present parameter estimates with their associated 95% confidence intervals (CI)
7 and p-values. Results were considered statistically significant for p-values <0.05. We
8 used IBM SPSS Statistics for Windows, Version 22.0. Armonk, NY: IBM Corp. in all
9 analyses.

10

11 **Results**

12 *Population characteristics*

13 Table I presents the demographic and needs of information for each diagnostic
14 group. Of the 280 patients that were invited, 253 returned the questionnaire (90.4%
15 response rate), 121 with AS and 132 with PsA. The rate of complete data (no missing
16 items) was 91.7% (n=111) and 88.6% (n=117) in the AS and PsA groups, respectively.
17 Responses to the screening question indicated that the majority of patients wanted to
18 know “everything” about their disease and only 6.7% and 10.9% of patients with AS and
19 PsA, indicated that they did not want any information.

20

21 *Comparison of educational needs by diagnostic group*

22 Table II presents the scores of educational needs by diagnostic group. Patients with
23 AS expressed, overall, a higher level of educational needs than those with PsA, reaching
24 statistical significance in the domains of “Treatments”, “Self-help measures” and
25 “Support systems”.

1 *Associations of educational needs with socio-demographic factors and disease*
2 *characteristics (univariable analyses)*

3 Table III presents the results of the univariable analyses in each diagnostic group:
4 (III. a.) differences in perceived educational needs by gender and educational
5 background; (III. b.) correlation between educational needs and age or disease duration.
6 Significant differences are outlined below:

7 *In AS:*

8 *Gender:* Female patients had higher educational needs than their male
9 counterparts in the domains of “Feelings”, “Self-help measures”, “Managing pain” and
10 “Movement”.

11 *Educational background:* Patients with a lower educational background had
12 higher educational needs than their counterparts on the domains of “Movement” and
13 “Feelings”.

14 *Age:* A significant negative correlation was found between age and educational
15 needs on the domain of “Self-help measures”: being young was weakly correlated ($r=-$
16 0.25) to having higher educational needs.

17

18 *In PsA:*

19 *Gender:* Female patients had higher educational needs than their male
20 counterparts in the domains of “Feelings”, “Self-help measures” and “Disease Process”.

21 *Educational background:* Patients with higher educational background had higher
22 educational needs than their counterparts regarding “Feelings” and “Self-help measures”.

23 *Age:* negative significant weak correlations ($0.2 < r < 0.3$) were found between
24 age and educational needs on “Managing pain”, “Disease process” and “Self-help
25 measures” domains.

1 *Disease duration*: having shorter disease duration was weakly but significantly
2 correlated ($0.2 < r < 0.3$) with higher educational needs regarding “Managing pain”,
3 “Movement”, “Disease process” and “Self-help measures”.

4 *Factors independently associated with educational needs (multivariable analyses)*

5 Results of multiple linear regression analyses are presented in Table IV.

6 In AS, gender was independently associated with educational needs: being female
7 was independently associated with high educational needs on the domains of “Managing
8 pain”, “Movement” and “Feelings”. Age, disease duration and educational background
9 were not independently associated with educational needs on any domain.

10 In PsA, being female was independently associated with higher educational needs
11 in the domain of “Feelings” and having shorter disease duration was independently
12 associated with higher educational needs on the domains of “Managing pain”,
13 “Movement” and “Disease Process”. Age and educational background were no longer
14 associated with educational needs on any domain.

17 **Discussion**

18 AS and PsA are the two best-studied SpA subtypes so far (17), notwithstanding little
19 is known about the educational needs of these patients, as only a few publications have
20 addressed this topic (14,16). Our cross-sectional study suggests that these patients have
21 important educational needs, which vary by diagnostic group. The main factors
22 independently associated with educational needs were gender in both AS and PsA and
23 disease duration in PsA.

24 Patients with AS reported, overall, a higher level of educational needs than those
25 with PsA (Table II). The reasons underlying these differences are not clear. Our results

1 suggest that the content of educational interventions should pay special attention to
2 “Disease process”, “Feelings” and “Managing pain” in both AS and PsA, as these
3 domains were considered more important than others. As participants with AS had higher
4 educational needs than those with PsA (“Treatments”, “Self-help measures” and “Support
5 systems”) perhaps educational interventions for the two diagnostic groups should be
6 separate (disease-specific). Nevertheless, as our study was performed using the data
7 collected in the context of the European validation of ENAT tool (not designed to
8 formally compare diagnostic groups), these differences between AS and PsA need further
9 confirmation, particularly, in studies ensuring comparability of cohorts regarding other
10 factors potentially influencing educational needs (e.g. disease activity).

11 After considering all factors in multivariable analyses (Table IV), only gender and
12 disease duration remained independently associated with educational needs. Gender was
13 the only factor independently associated with educational needs in both diagnostic
14 groups. This association was more evident in AS, where being female was independently
15 associated with higher educational needs in three domains: “Managing pain”,
16 “Movement” and “Feelings”. Other international studies using the ENAT have reported
17 similar gender differences in AS and PsA (11, 13), although they were based on
18 univariable analyses only. Our data add robustness to this evidence by controlling for
19 other factors. Recent evidence suggests that female patients with AS have functional MRI
20 signals consistent with central chronic pain (18). Together with our findings, this
21 highlights the special importance of addressing “Managing pain” in patient education for
22 patient subgroup. In PsA, being female was independently associated with higher
23 educational needs on the “Feelings” domain only.

24 In the PsA dataset, disease duration was independently associated with educational
25 needs: shorter disease duration was associated with higher levels of educational needs in

1 “Managing pain”, “Movement” and “Disease process” domains, mirroring the
2 associations found in the univariable analysis. Previous studies reported no association
3 between disease duration and educational needs in AS and PsA (14,16). However, this
4 may be explained by methodological limitations of those studies as they used univariable
5 analysis only and disease duration was dichotomized as shorter/longer (cut-off of \leq / $>$ 10
6 years in AS (14) and \leq / $>$ 25th percentile of disease duration in PsA (16)). Our study used
7 multivariable analyses and disease duration was analysed as a continuous variable (i.e.
8 taking advantage of the entire scale), thus providing more robust conclusions.

9 Strengths of our study are: the few missing data; the use of an instrument (ENAT
10 questionnaire) with strong construct validity and reliability, cross-cultural validity,
11 allowing for cross-cultural comparisons (11); age and disease duration were included in
12 the analysis as continuous variables, taking advantage of the entire scale, instead of
13 “artificially” creating cut-offs to dichotomize these variables; and, for the first time, the
14 use of multivariable analysis to determine factors independently associated with
15 educational needs in AS and PsA.

16 Our results should be interpreted in the light of some limitations. Data were collected
17 from a sample of patients attending one single centre, which limits the generalisability of
18 the results. However, as the socio-demographic features are in agreement with
19 expectations for AS and PsA populations (19), our results are likely to provide relevant
20 information at group-level for both diseases, at least in Portugal. Some possible
21 determinants of educational needs, such as disease activity, physical function,
22 comorbidities, treatment, economic status, family support and pre-existing knowledge of
23 the patients were not addressed. Future research should take these factors into account.

1 In conclusion, our results suggest that educational needs vary by diagnostic group,
2 gender and disease duration. Educators should be aware of these differences and target
3 resources appropriately.

4
5 **Contributors** AM and PMM collected the data. MN, MLM and RJOF designed the study.
6 MLM and RJOF analysed the data. MLM prepared the first version of the manuscript.
7 MN and JAPS supervised and contributed to all steps of the work. All authors critically
8 interpreted the results, reviewed the draft versions and gave their approval of the final
9 version of the manuscript.

	Everything, n (%)	74 (61.7)	61 (47.7)

AS, Ankylosing Spondylitis; PsA, Psoriatic Arthritis; SD, standard deviation

*Percentages of patients with missing data were $\leq 3.0\%$, except for Educational background in patients with PsA (6.8%) and Disease duration in AS (6.6%) and PsA (9.1%).

1 **Table II.** Comparison of educational needs between patients with AS and PsA.

Domain (score range)#	AS (n=121)			PsA (n=132)			Difference		
	N	Mean (SD)**	Mean as % of maximum##	N	Mean (SD)**	Mean as % of maximum	MD (95% CI)	t-statistic	p-value
1. Managing pain (0-24)	121	14.3 (5.2)	59.6%	130	13.3 (6.4)	55.4%	1.00 (-0.46 to 2.46)	1.360	0.175
2. Movement (0-20)	121	10.6 (3.8)	53.0%	131	10.5 (4.8)	52.5%	0.12 (-0.95 to 1.19)	0.227	0.821
3. Feelings (0-16)	121	9.5 (3.8)	59.4%	130	9.5 (3.5)	59.4%	0.05 (-0.86 to 0.96)	0.108	0.914
4. Disease process (0-28)	121	18.2 (5.5)	65.0%	130	17.6 (6.2)	62.9%	0.58 (-0.88 to 2.04)	0.786	0.433
5. Treatments (0-28)	112	14.6 (5.2)	52.1%	119	12.9 (5.2)	46.1%	1.68 (0.32 to 3.03)	2.444	0.015
6. Self-help measures (0-24)	121	14.8 (5.3)	61.7%	131	12.8 (6.1)	53.3%	1.98 (0.57 to 3.40)	2.759	0.006
7. Support systems (0-16)	120	9.3 (3.6)	58.1%	131	7.3 (3.8)	45.6%	2.00 (1.08 to 2.92)	4.284	<0.001
Total PortENAT score (0-156)	111	88.6 (23.2)	56.8%	117	79.7 (26.4)	51.1%	8.88 (2.37 to 15.39)	2.688	0.008

2 # Higher scores mean higher level of educational needs.

3 ## Determined as: (mean value of the domain*100) / maximum value of the domain. This percentage allows easier comparison between domains.

4 AS, Ankylosing Spondylitis; PsA, Psoriatic Arthritis; MD, mean difference (AS scores minus PsA scores); PortENAT, Portuguese Educational Needs Assessment Tool.

5 **Rasch-transformed PortENAT scores.

Table III. Educational needs of both diagnostic groups by gender, educational background, age and disease duration (univariable analyses).

III. a. Comparison of educational needs in each diagnostic group by gender and educational background.

ENAT Domains (range)			Pain (0-24)	Movement (0-20)	Feelings (0-16)	Disease process (0-28)	Treatments (0-28)	Self-help (0-24)	Support (0-16)	Total score (0-164)
