4 Introduction

This report provides details of work performed on the Environmental Change Network (ECN) contract to ENSIS Ltd. involving the preparation of historic (March 2007 – March 2012) ECN diatom samples and the analysis of diatom time-series from three river sites; the River Eden, Cumbria, the River Wye and the River Frome.

Diatoms were collected from ECN sites and prepared for analysis following protocols described in the United Kingdom Environmental Change Network's "Protocols for Standard Measurements at Freshwater Sites" (Sykes *et al.*, 1999). The samples were taken on three occasions each year (Spring, Summer and Autumn) from three close-by but different sampling stations – coded S01, S02 and S03, and thus totaled a maximum of nine samples per year. For a variety of operational reasons not all samples were collected in all years at all sites.

Diatom samples prepared and archived for this project are listed in Appendix 1. Slides for the samples to be counted from the three rivers discussed above were prepared first. Subsequent preps started with the oldest samples and moved forward through time, finishing with samples dated up to the end of 2012. One sample from the River Esk, ESK076, could not be located. Full details of all samples received have been sent to the ECN data centre in electronic format.

For the time-series analysis component of the project it was decided to count a sub-set of all the available samples from each site. To keep time-series as long as possible, and to remove the potentially confounding effects of multiple sampling locations, a sample collected from location S01 on each discrete site visit (date) was chosen for diatom analysis. Approximately 500 diatom valves were counted per sample by Amy Burgess using a light microscope with phase contrast at 1000x magnification. Count data were recorded on spreadsheets and transferred to ENSIS where they have been added to the ECN diatom database. Full details of all diatom counts have subsequently been sent to the ECN data centre in electronic format.

The diatom count data was run through the DARLEQII program (Kelly *et al*, 2011) in order to generate Trophic Diatom Index (TDI), Ecological Quality Ratio (EQR) and status class values (high, good, moderate, poor, bad) for each sample at each of the three sites. Approximate mean alkalinity values for the calculations were provided by ECN as being 150 mg/l for the River Eden, Cumbria, 100 mg/l for the River Wye and 200 mg/l for the River Frome. Both TDI3 and TDI4 scores were calculated for all samples, but under advice from one of the program authors (Kelly, *pers comm.*) TDI4 scores were deemed more representative of the three sites and are the scores reported here. Table 1 is taken from the DARLEQII user guide (Kelly *et al*, 2011) and describes the output fields provided in the results section for each site below. Electronic copies of the full DARLEQII program output plus a copy of the DARLEQII program user manual have been provided to the ECN data centre.

Table 1 Trophic Diatom Index (TDI) calculation output field descriptions

Field name	Field description
Sample sum	Sum of the counts or percentages of all taxa in a sample
Sum TDI4	Sum of the counts or percentages for all taxa in a sample that are matched to taxa in the master taxon list and included in the TDI calculation. If all taxa are matched this will be the same as the Sample sum. Comparison of these two fields will indicate if there are important taxa present in the sample but not included in the status calculations
TDI4	TDI score for each sample using the revised TDI taxon scores for rivers.
eTDI4	Expected TDI score for each sample according to site-specific prediction (rivers)
EQR TDI4	Ecological Quality Ratio for each sample based on predicted TDI for observed alkalinity and season (rivers).
Class	Status class based on EQR
% Planktic	Percentage of planktic diatoms in the sample. These are excluded from the status calculations

Field name	Field description
% Motile	Percentage of the motile diatoms in the sample
%OrganicTolerant	Percentage of organic pollution tolerant diatoms in the sample
%Saline	Percentage of diatoms tolerant of slightly saline waters
Comments	List of any warning messages generated during calculations for individual samples.

5 Site R01. River Eden, Cumbria

Figure 1 River Eden. Looking north from the bridge on the B6412. Image from Google Streetview

5.1 Site Description

"The river rises south of Kirkby Stephen on the Cumbria /Yorkshire border and flows northwards to Carlisle before discharging to the Solway Firth. The eastern part of the catchment is drained by short, relatively steep streams from the Pennines; the western part includes tributaries of the Eamont system which arise in the eastern hills of the Lake District, and the major lakes, Ullswater and Haweswater. The catchment is largely rural,

with farming the main industry. There are significant settlements on the upper part of the river at Kirkby Stephen and Appleby-in-Westmorland. Water quality in the upper reaches is classified as good and drinking water is abstracted to supply the city of Carlisle. The river is excellent for salmon (*Salmo salar*) fishing and also supports a sea trout (*Salmo trutta*) run. Many other species of fish are also found, eg brown trout (*Salmo trutta fario*), grayling (*Thymallus thymallus*), chub (*Leuciscus cephalus*), dace (*Leuciscus leuciscus*), eel (*Anguilla anguilla*), minnow (*Phoxinus phoxinus*), loach (*Barbatula barbatula*), river lamprey (*Lampetra fluviatilis*), sea lamprey (*Petromyzon marinus*), and brook lamprey (*Lampetra planeri*), stickleback (*Gasterosteus aculeatus*) and bullhead (*Cottus gobio*). Otters and native crayfish (*Austropotamobius pallipes*) are also found in the Eden catchment. The Eden at Temple Sowerby is within the "River Eden and Tributaries" SSSI, and the proposed Special Area of Conservation (SAC) under the EC Habitats and Species Directive.

The sampling site is in an upland farming area at an altitude of about 100 m AOD. The surrounding countryside is hilly, with some woodlands, rising to the bare slopes of the Pennine hills to the east. These have been mined for lead and silver in historic times, and gypsum is still extracted. The underlying bedrock is Permo-Triassic Penrith Sandstone, with smaller tributaries of the Eden draining from the surrounding Carboniferous Limestone. The market town of Appleby, with a population of about 3 000, is roughly 14 km away by road. Its primary influence on the river is the discharge from the Sewage Treatment Works 16 km upstream, which currently has secondary treatment and, since January 1999, phosphorus stripping of the wastewaters it receives.

The ECN site is at the Eden Bridge in Temple Sowerby, at NGR 3604 5282, where the A66 trunk road crosses the river." ([ECN website](#), 2013).

5.2 Diatom Count Summary

30 ECN diatom samples from the location S01 in the River Eden, Cumbria (Table 2.) were either retrieved from the UCL archive or prepared into diatom slides and counted using standard methods (Battarbee *et al.* 2001). Percentage abundance time-series plots of diatom species, generated using the program C2 (Juggins, 2007), are shown in Figure 2 and include all species occurring at abundances greater than two percent. Diatom species recorded and the number of samples in which they occurred are presented in Table 3. and Figure 3. Trophic Diatom Index (TDI) scores (Kelly *et al.*, 2008) were calculated for each sample and are provided in Table 4. Exact dates were not recorded for the three samples from the River Eden in 2006, so the mid-summer dummy date of 22/06/2006 has been used for the sample ECUM064. No samples were collected in 2001 due to foot and mouth disease restrictions.

6 Site R05. River Wye

Figure 4 River Wye. Looking southwest from the the A466. Image from Google Streetview

6.1 Site Description

"The River Wye is one of the largest rivers in Britain. It rises on the Plynlimon mountains at 741m AOD and flows through several towns including Rhayader, Builth Wells, Hay-on-Wye and Hereford before meeting the Severn Estuary at Chepstow. The total catchment area is 4136 km² and the population size of 226,000 is centred on the main towns. The River Wye catchment is one of idyllic beauty and unspoilt scenery. The River Wye itself is a Site of Special Scientific Interest and one of the most important rivers in Britain in nature conservation terms. Much of the lower valley is an Area of Outstanding Natural Beauty.

The surface water in the Wye and its tributaries is mostly unpolluted, so much of it is suitable as a source of drinking water and for supporting a salmon and trout fishery. Nevertheless, certain rivers and streams in the upper catchment suffer from acidification

and localised pollution problems from inadequate sewerage and agricultural sources also exist. The Wye is one of the best known salmon rivers in England and Wales. Shad and Sea Lamprey also migrate into the Wye. The river corridor supports a variety of plant communities, otters, water voles, several bat species, dippers, sandmartins, kingfishers and little ringed plovers. The biological quality of the river is generally good and supports several rare or scarce species including the mayfly *Potamanthus luteus*, the freshwater pearl mussel *Margaritifera margaritifera* and the native crayfish. The river also supports several rare species of non-aquatic invertebrates associated with gravel shoals." ([ECN website](#), 2013).

6.2 Diatom Count Summary

28 ECN diatom samples from the location S01 in the River Wye (Table 5.) were either retrieved from the UCL archive or prepared into diatom slides and counted using standard methods (Battarbee *et al.* 2001). Percentage abundance time-series plots of diatom species, generated using the program C2 (Juggins, 2007), are shown in Figure 5 and include all species occurring at abundances greater than two percent. Diatom species recorded and the number of samples in which they occurred are presented in Table 6. and Figure 6. Trophic Diatom Index (TDI) scores (Kelly *et al.*, 2008) were calculated for each sample and are provided in Table 7. No samples were collected in 2001 due to foot and mouth disease access restrictions.

7 Site R08. River Frome

Figure 7 River Frome. Looking east from the bridge on the B3070. Image from Google Streetview

7.1 Site Description

"The River Frome is essentially a rural catchment of high amenity and ecological value. The upper part of the catchment lies within the Dorset Area of Outstanding Natural Beauty and is characterised by steep-sided valleys. The only large urban area within the catchment is Dorchester (population 15,104). In the upper reaches the river is dependent on springs and groundwater levels for flows. Many of the streams are Winterournes and the streams cease to flow in the Summer or are perched where the River goes underground for part of its length. All stretches of river above Holme Bridge fit into the Environment Agency's River Objective classes 1 & 2. These classes describe water of very good, or good quality suitable for all fish species. The majority of the catchment fits into the Environment Agency's Biological Classification class A. Land use in the catchment is typically permanent grassland with dairying or stock rearing, with some cereals and natural wetland habitats. The majority of the upper reaches lies on

chalk which produces the high groundwater component of flow. The lower reaches are dominated by sands, gravels and clays. Rainfall in the catchment varies between 850-1100 mm a year. The Q95 is 34% of the mean annual flow reflecting how much of the flow depends on groundwater and how slowly the River responds to rainfall events.” ([ECN website](#), 2013).

7.2 Diatom Count Summary

39 ECN diatom samples from the location S01 in the River Frome (Table 8.) were either retrieved from the UCL archive or prepared into diatom slides and counted using standard methods (Battarbee *et al.* 2001). Percentage abundance time-series plots of diatom species, generated using the program C2 (Juggins, 2007), are shown in Figure 8 and include all species occurring at abundances greater than two percent. Diatom species recorded and the number of samples in which they occurred are presented in Table 9. and Figure 9. Trophic Diatom Index (TDI) scores (Kelly *et al.*, 2008) were calculated for each sample and are provided in Table 10.
