Forward

The Life Study questionnaires were developed by the scientific leadership team together with experts from a wide range of disciplines drawn from the biomedical, clinical and social science research communities who formed part of a wider affiliated scientific network. The questionnaires were designed to reflect the key research themes of the study, capitalise on the unique opportunities afforded, and to enable a wide range of research questions and policy issues relevant to children to be explored.

The Life Study questionnaires were initially developed by members of the Scientific Protocol Development Group with input from Scientific Working Groups, each co-chaired by social and biomedical scientists. Ad hoc subgroups and external experts contributed on focussed aspects. A public consultation took place on the draft protocol in July 2012, followed by an independently conducted web survey with input from a wide range of disciplines.

Development of the non-resident father questionnaire was funded by the Nuffield Foundation, as an enhancement to Life Study, to augment the recruitment and retention of resident and non-resident fathers/partners. This questionnaire was developed by the Life Study Expert Advisory Subgroup on Fathers and Partners which included questions from the resident partner's questionnaire and questions developed for non-resident fathers.

The Life Study Scientific Steering Committee (members listed below) is responsible for the content of this questionnaire, having approved its final content and any revisions needed in the light of experience following piloting. They, and key members of the Life Study team, are listed as authors of this questionnaire.

Acknowledgements

The authors acknowledge with gratitude the contributions made by members of the Expert Advisory Group on Fathers and Partners, as well as many other advisory and working groups and individual experts, to the development of this Life Study questionnaire, all of whom gave generously of their time, expertise and advice on specific questions, instruments and topics. The support of the Centre for Facilitation in using consensus methods to review and prioritise the questionnaire content is gratefully acknowledged.

1. Introduction

As described in the scientific protocol, Life Study was designed to include two integrated components, referred to as the Pregnancy Component and the Birth Component. The Pregnancy Component comprised a clustered sample of women recruited during pregnancy, who would be invited with their partners to attend appointments in a Life Study Centre, located in their local maternity unit. Visits to the Life Study Centres were to take place during pregnancy and again when their babies were approximately six and twelve months of age. The Birth Component comprised a UK-wide probability sample of mothers identified from birth registration records who, together with their partners, would be invited to take part in a home interview when their baby was approximately six months of age, with a follow-up web or telephone interview at twelve months of age.

The table below shows the timing of the questionnaires for mothers and partners, and in the birth component only, for non-resident fathers. The questionnaires were designed as longitudinal instruments and to enable data from the two components to be integrated, while addressing some unique scientific opportunities afforded by the different components.

	Pregnancy visit	6 month visit	12 month visit
Pregnancy component	Mother questionnaire	Mother questionnaire	Mother questionnaire
	Partner questionnaire		
Birth component		Mother questionnaire	Mother questionnaire
		(Resident) Partner questionnaire	
		Non-resident father questionnaire	

The initial questionnaires of Life Study were administered using computer assisted personal interviewing (CAPI) and computer assisted self-interviewing (CASI). These computerised questionnaires were developed using SPSS Dimensions software. Mothers participating in the six and twelve month visits were also to receive a short paper questionnaire to be completed in the home setting, either before or after their visit to a Life Study Centre or home visit by fieldwork staff.

At the time of closure of Life Study in October 2015, only the Pregnancy Component pregnancy visit questionnaires had been piloted and used; the twelve month questionnaire had not been programmed in its final format and hence has not been published. The Birth Component mother and resident partner six month questionnaires had been piloted (but not updated following the pilot); the non-resident father questionnaire, while developed and published, had not been tested due to insufficient response in the pilot.

1.1 Structure of the questionnaires

The questionnaires were developed on a modular or topic basis, for example, Parental and Family Health, Child Sleeping and crying. Some modules had both CAPI and CASI questions, other modules were administered in either CAPI or CASI. The demographics section which gathered information about household members was always asked as CAPI. Sensitive questions, that is, questions asking about personal issues, were generally asked as CASI. Where possible, questions with open responses, which required an answer to be typed, were asked as CAPI. Where feasible the mode of administration was kept the same between the two components of the study and between sweeps, however, some differences occurred.

In both components of the study, the visit started with signing of the consent forms. The consent forms were paper based, but had an accompanying CAPI element, that enabled interviewers to record responses made and collect some additional information, for example to facilitate record linkage. In the Birth Component, in order to reduce this initial burden and give the questions seeking permissions to record linkage a context, some of these questions were embedded within the CAPI sections at relevant points.

In the Pregnancy Component, participants completed a section of CAPI which was followed by two sections of CASI, broken up by collection of biological samples and various other measurements, assessments and observational tasks. A greater proportion of questions were asked as CASI in order to maximise the throughput of participants with given staffing levels.

As the Birth Component was administered by fieldwork staff conducting interviews in a home setting, a higher proportion of the non-sensitive questions were administered as CAPI, so that rapport was built with the participant. This also had the advantage that the interviewer could manage the time taken to conduct the interview and was engaged with the participant for a greater proportion of the visit. Depending on what was most appropriate, questions of a sensitive nature were either asked as CASI or were administered as CAPI towards the end of the interview. Therefore in the Birth Component six month visit, there was an initial CAPI, followed by a section of CASI and then a final CAPI.

All the questionnaires had a defined and fixed order of questions. For any given questionnaire the module orders were defined and the questionnaires were programmed such that interviewers and participants had to work through from start to end. However, the questionnaires could be suspended at any point, for example, because the child needed attention, and recommenced at the same point.

In the Pregnancy Component, mothers and partners questionnaires were completely independent, whereas in the initial sweep of the Birth Component, mothers needed to complete the questionnaire before their partner, as various responses, such as information about household members, were then fed from the mother's questionnaire into the partner's questionnaire.

The following sections of the introduction explain the format of the questionnaire as presented in the tables in the rest of this document.

1.2 Variable labels and names

The variable label is shown in the tables in the column headed "Variable". The variable name is presented underneath the variable label within brackets, [].

Each question has a unique variable name, specified according the 'Life Study variable names' document. The route variable name is shown in this document. Within the datasets, this route variable name has a number of prefixes and suffixes added, for example to denote the respondent and sweep.

The route variable names were derived from the focus of the question and are generally eight characters long but sometimes less, if the variable name is meaningful. The minimum number of characters is four. The use of numbers within the route variable name is generally avoided; the exceptions relate to a series of questions within a recognised instrument. All route variable names start with an upper case letter. This document shows the following charters are a mix of upper and lower case characters, however, within the datasets, we plan to transform these so that just the initial letter is in upper case.

1.3 Source of the question

Most of the Life Study questions are taken from existing surveys and instruments. Very few of the Life Study questions are new. The source of each question is shown in this document. Some questions may have been used in a number of other cohort studies or surveys and at multiple sweeps. When the Life Study questionnaires were developed, experts often recommended a specific cohort or survey as a reference. Life Study staff did not have sufficient time to follow-up the full provenance of each question, so what is listed, is the origin of the question that was used by the Life Study team.

Some questions needed to be modified or adapted to make them suitable for use in Life Study. Where this was the case, the origin says “Adapted from”.

1.4 Question

The “Question” column gives details of the wording of each question. If the question is administered as CAPI, then this is what is read out by the interviewer. If the question is administered as CASI, then this is what appears on the screen for the participant to read.

Text in UPPER CASE, is either an interviewer instruction, or there to guide the interviewer. Where there is a showcard for the interviewer to use, this is written as an interviewer instruction. Each showcard has a unique reference number and the participant is asked to turn to that card to read the response options available (so that the interviewer does not need to read out a long list of items). Participants are given a pack of laminated cards that are in the correct order as they appear in the questionnaires.

1.5 Textfills

Textfills are used to adapt the question wording (or response options) for an individual respondent, based on information they have given as the questionnaire proceeds, for example, by adding in the name of their baby and referring to them in the correct gender. In this example the textfills would be as follows: ^[cohort baby name] and ^[he/she].

In some cases, textfills are used to adapt or add to the wording at specific sweeps or under specific circumstances. For example, some questions on household income had a textfill ^[and your partner] but only if the respondent had a partner and the partner was resident in the same household. In these cases the wording of the textfill is shown and the programmers developing the CAPI and CASI were given additional information as to what was required.

1.6 Responses

There a number of different response types and these are shown on the first line of the “Responses” column. Response types are as follows:

1. ‘Choice: multiple’ - the participant can choose multiple response options from a given list
2. ‘Choice: single’ – the participant can choose only one response option from a given list
3. ‘Open: XX’ – the participant has to type in the answer and XX denotes the maximum number of characters allowed
4. ‘Number: A, B, C..D’ – the participant has to enter a numeric answer. ‘A’ represents the number of decimal places allowed, ‘B’ is the maximum number of characters that can be entered, ‘C..D’ is the range (lower and upper values) permitted

5. 'Date: dd/mm/yyyy or mm/yyyy or yyyy' - the participant needs to enter a date either as a full date, or month and year only, or year only.
6. 'Control:' – this is used where a response is not required, for example there is some introductory text, followed by instructions to advance to the next screen.

The response type is then followed by the response options, if the response type is 'Choice: multiple' or 'Choice: single'.

The response options are shown as a table with a numbered list of items. The interviewers (CAPI) and respondents (CASI), are presented with the list but the numbers are not shown. These numbers do however, appear in the datasets. For questions without a showcard, interviewers read out all the options for participants to select their answer(s).

Within the SPSS Dimensions CAPI and CASI instruments, answers to questions with predefined response options are entered by selecting the relevant response(s). CASI sections are administered on touch screen tablets, so touching the relevant answer, selects it. Questions that allow multiple responses, include the wording: CODE ALL THAT APPLY (if CAPI) and "Please choose all that apply" (if CASI). If an incorrect answer is selected, it can be deselected and then the correct answer chosen. Some of the questions which allow multiple responses to be made, also have some responses which are exclusive, that is, they cannot be selected with any of the other responses. The CAPI and CASI instruments are programmed to take account of single and multiple response questions, exclusive responses and also combinations of answers which were not permitted, for example because they are contradictory. Questions with open text, require the answer to be typed in.

1.7 'Don't know' and 'Prefer not to answer'

'Don't know' and 'Prefer not to answer' options were allowed within both the CAPI and CASI as participation in Life Study was voluntary and it was important that participants did not feel pressurised to answer all questions, if they were not comfortable with doing so. Virtually all questions allowed a 'Prefer not to answer' response and some questions additionally allowed a 'Don't know' response but only if it was felt that a participant may genuinely not know the answer. In CAPI, 'Don't know' and 'Prefer not to answer' are shown on the screen for interviewers to select if necessary, whereas in CASI, these options only appear on the screen if the participant tries to move to the next question without answering the current question.

(Details regarding use of 'Don't know' and 'Prefer not to answer' responses for each question, are not shown within this document).

1.8 Checks

Soft and hard checks are built into the programming of the CAPI and CASI questionnaires. Soft checks ask interviewers or participants to review their answer as it exceeds an expected range. They are given the opportunity to change their answer or proceed if they feel their answer is correct. Hard checks are used where an answer given is not feasible or contradictory to information already provided. In this circumstance, the answer has to be changed before proceeding to the next question.

1.9 Universe and routing instructions

Universe statements are based on Boolean logic and contain information to indicate when that question has to be applied: respondent type (mother, partner, non-resident father), component of the study (Pregnancy or Birth), sweep (pregnancy visit, six month visit, 12 month visit) and the mode of interview (CAPI or CASI).

RespType = 1 indicates the question is asked of mothers

RespType = 2 indicates the question is asked of partners

RespType = 4 indicates the question is asked of non-resident fathers (B.C. only)

Sweep = 1 indicates the question is asked at the Pregnancy Component, pregnancy visit

Sweep = 2 indicates the question is asked at the Pregnancy Component, six month visit

Sweep = 3 indicates the question is asked at the Pregnancy Component, 12 month visit

Sweep = 4 indicates the question is asked at the Birth Component, six month visit

ModeType = 1 indicates the question is asked as CAPI

ModeType = 2 indicates the question is asked as CASI

For many variables, the Universe also includes additional conditioning based on responses to other variables. In some cases, a specific response leads to an additional question being asked and on other occasions a specific response may lead to a number of questions being omitted.

<> is used to mean is not equal to

'@ sweep x' indicates that information is fed forward from an earlier sweep

(?) is used where the universe statement could not be written fully, as the routing relied on interaction with information stored in a Participant Management System. In such instances, the text in the universe statement provides a written explanation of the routing that takes place.

This document has been prepared as a questionnaire for a particular respondent at the birth component six month visit. For those variables which appear in this document, re-occurrences of that variable for other participants (mothers, partners and non-resident fathers) can be seen by looking at the universe statement. However, please note that there

are other Life Study variables which don't appear in this document and these will be found in the other Life Study questionnaires.

1.10 Multiple births

The Life Study questionnaires were designed to allow for singleton, twin and triplet cohort members. At the six month and twelve month sweeps, a number of questions relating to the baby are asked separately of each cohort member. If there are just one or two questions of this nature within a module, then the questions repeat for each baby, one after the other. If however, there are a series of questions which need to repeat for each baby, then the whole section is asked of the first baby and then repeated for the next baby. This allows the mother to answer related questions focussing on each baby separately.

1.11 Looped sections

Similarly, in some modules of the Life Study questionnaires, individual questions, or sequences of questions are repeated a number of times, based on information provided by the participant. For example, in the Demographics module, the respondent is asked a number of questions about each member of their household, based on the number of people they live with.

1.12 This document

This document now details the questionnaires used for non-resident fathers receiving a six month home visit within the Birth Component of Life Study.

2. Computer Assisted Personal Interview (CAPI) Part 1

2.1 Demographics

Variable	Source	Question	Responses	Universe
Number of household members [PersNo]	Millennium Cohort Study (MCS) First Survey	<p>First, I'd like to ask a few questions about yourself and the people who live with you.</p> <p>Including yourself, how many people live with you regularly as members of your household?</p> <p>MEMBERS OF THE SAME HOUSEHOLD MUST EITHER SHARE AT LEAST ONE MEAL A DAY OR SHARE LIVING ACCOMMODATION.</p> <p>IF HH MEMBER HAS BEEN OR IS LIKELY TO BE AWAY FOR 6 MONTHS OR MORE, COUNT AS RESIDENT ONLY IF S/HE IS GOING TO COME BACK TO LIVE THERE</p>	Number: 0, 2, 1..99	<p>IF (RespType = 1 or 4) // Mother or Non-resident partner AND (Sweep = 4) // 6 months AND (ModeType = 1) // CAPI</p>

<p>Child maintenance intro</p> <p>[MaintInt]</p>	Adapted from Understanding Society and Kids Aren't Free	<p>When parents don't live together, they sometimes make arrangements for the parent who doesn't live with their children to pay maintenance to help support them. Sometimes, these arrangements are made through the Child Maintenance Service (previously called the Child Support Agency) or the courts. At other times, these arrangements are made privately between parents.</p>	Control:	<p>IF (RespType = 4) // Non-resident Partner</p> <p>AND (ModeType = 1) // CAPI</p> <p>AND (Sweep = 4) // 6 months</p>

Variable	Source	Question	Responses	Universe
				AND (?) // No second email address on record for respondent
Second email address [EmailB]	New	Please can you give it to me? PLEASE ENTER FULL EMAIL ADDRESS. EMAIL ADDRESSES WE HAVE ARE: ^[P1_Email1] ^[P2_Email1] ^[NRF_Email1]	Open: 50	IF (RespType = 1 OR 2 OR 4) // Mother or Partner or Non-Resident Father AND (Sweep = 4) // 6 months AND (ModeType = 1) // CAPI AND ((EmailChB = 2) // Email address incorrect OR (NoEmIChB = 1)) // Agreed to give second email address

NB. In this section, the survey interacted with information stored in a Participant Management System. It was not possible for the Universe Statements to take this into account and so where this was an issue, “(?)” appears, but the text provides a written explanation of the routing that took place.
