Abstract

The regulation of corporate behaviour has persisted in spite of peaks of neo-liberalism in many developed jurisdictions of the world, including the UK. This paradox is described as 'regulatory capitalism' by a number of scholars. Of particular note is the proliferation of corporate regulation to govern 'socially responsible' behaviour in recent legislative reforms in the EU and UK. In seeking to answer the broader question of whether corporate regulation indeed effectively governs and moderates corporate behaviour, this paper focuses on the nature of corporate regulation. Although different pieces of corporate regulation purport to achieve different objectives and impose different types of obligations, this paper offers an institutional account of corporate regulation, specifically in relation to the UK's regulatory capitalism, as the UK is typically held up as having a liberal market economy (which is broadly similar to the US). We argue that the nature and effectiveness of corporate regulation crucially depends on the nature of 'regulatory capitalism' in the type of economic order under discussion. Hence the study of the UK's economic order and its efforts in introducing corporate regulation to change corporate behaviour holds lessons more generally for corporate regulation in economies that share similar features. The examination in this article provides an overarching framework for distilling the achievements and limitations of corporate regulation in such economic contexts. First, the paper clarifies that regulatory capitalism in the UK is characterised by three key tenets which reflect the spirit of the liberal market economy embraced here. Over time, gaps have been revealed in the achievements of these tenets of regulatory capitalism, particularly in relation to social expectations of the regulation of corporate behaviour. These gaps have become the subject of debates in the realm of 'corporate social responsibility' (CSR), where business, civil society and the state frame the expectations of corporate behaviour in contested ways such as in relation to scope, motivations, theoretical and practical premises. In the aftermath of the global financial crisis 2007-9, we observe increasing legalisation in the EU and UK of CSR issues, framed in 'new governance' regulatory techniques. They hold promise for change in corporate conduct through deeper forms of corporate engagement and accountability but they appear at the same time relatively undemanding and susceptible to cosmetic compliance. By discussing key examples in new corporate regulation reforms in the EU and UK, we seek to understand why recent corporate regulation reforms seem to offer mixed and in some cases, relatively limited achievements in governing corporate behaviour. We argue that the institutional account of corporate regulation continues to be able to explain regulatory weaknesses and limited achievements, in spite of the deployment of 'new governance' regulatory techniques. This is because 'new governance' regulatory techniques are implemented within the ethos of regulatory capitalism which limits their potential to introduce paradigm shifts. However the limitations of these regulatory reforms highlight more sharply the institutional shifts that are needed in order to connect the efficacy of corporate regulation with meeting social expectations.

An Institutional Theory of Corporate Regulation

Iris H-Y Chiu*

Introduction

The regulation of corporate behaviour has persisted in spite of peaks of neo-liberalism in many global jurisdictions, including the UK. This paradox is described as ‘regulatory capitalism’.¹ Of particular note is the proliferation of corporate regulation to govern ‘socially responsible’ behaviour in recent reforms in the EU and UK.

The inquiry in this paper is what corporate regulation has achieved over recent decades and contributes to the discourse on ‘regulatory effectiveness’. A recent paper in empirical research finds that in post-1970 common law countries, corporate regulation is reactive in nature, and has little role to play in moderating future corporate behaviour.² Despite the overall pessimistic finding, we observe the indefatigable advancement of corporate regulation, from product liability³ and environmental degradation,⁴ to the recent surge in corporate regulation dealing human rights, corruption and stakeholders.⁵ Can ‘regulatory effectiveness’ really be dismissed? We recognise that regulation can be introduced for a variety of reasons including protectionist purposes⁶ but we focus here on the objective of moderating corporate excesses or changing corporate behaviour.⁷ Even as regulation is susceptible to being captured,⁸ reactive or weak, many commentators⁹ continue to affirm its importance in meeting public interest objectives, supplying public and collective goods, meeting distributive and welfare objectives and responding to the needs of society.

The precise weighting of regulatory effectiveness is not what this paper sets out to do, rather, we argue that an *institutional* account of corporate regulation is necessary to illuminate the issue of regulatory effectiveness in changing corporate behaviour. We seek to give an account of how corporate regulation works *as an institution* of our capitalist tradition, in order to appraise its achievements and limitations. The institutional account of corporate regulation also sheds light on a number of more specific issues, in particular, the likely ‘effectiveness’ of a new trend in corporate

regulation targeted at the 'social responsibility' aspects of corporate behaviour,¹⁰ and the achievements and limitations of new regulatory techniques such as 'new governance'¹¹ that support such regulation. We seek to understand why 'new governance' techniques, which have been developed with much promise in respect of governing corporate behaviour, have only been supported by a track record of mixed results.

This article defines the scope of 'corporate regulation' as law that addresses corporate behaviour but not limited to the corporate form or governance. Aguilera et al¹² provide a comprehensive mapping of the drivers for corporate behavioural change at the levels of the individual, the firm/organisation, the national/institutional and the supranational. The range of behavioural drivers include individual ethics, organisational pressures and culture, bottom-up third party pressures and incentives, law and regulation, and supranational developments such as international codes and soft law. Corporate regulation is one but an important driver for change in corporate behaviour.¹³ Regulation can, through a variety of techniques,¹⁴ incentivise or force changes to corporate behaviour.¹⁵ The regulatory context is also important for developing 'soft law'¹⁶ and initiatives that complement or co-shape one another for influencing change in corporate behaviour.¹⁷ Indeed the existence of regulation is often crucial to the success of voluntary, third party or civil society-led initiatives.¹⁸ Hence in focusing on giving an institutional account of corporate regulation, this article does not marginalise the importance of other types of initiatives. Quite the contrary, it argues that a rich understanding of the institution of corporate regulation is essential to the larger picture of

developing and evaluating endeavours by governments, civil society and indeed business, to change corporate behaviour.

Section A explores the development of corporate regulation in the UK as an institution of 'regulatory capitalism'. Corporate regulation is integral to the ethos of the capitalist tradition embraced in many jurisdictions in the world.¹⁹ We discuss the key tenets and achievements of regulatory capitalism, but also highlight its limitations as crucially defined by our capitalist economic model.

Section B discusses how regulatory limitations have been increasingly exposed and challenged in the social sphere. Calls for corporate social responsibility (CSR) have become louder, entailing developments in the voluntary and largely transnational space, in the form of 'new governance' and 'soft law'. The global financial crisis 2007-9 then brought about a turning point in business-government relations and an unprecedented surge in the legalisation of CSR. Section C analyses this phenomenon in several regulatory reforms introduced in the UK and EU, to shed light on whether such legalisation indicates paradigm-shifts in corporate regulation. We find mixed results and explain our findings in the institutional account of corporate regulation. Section E concludes.

A. Corporate Regulation in the UK as a Phenomenon of Regulatory Capitalism

The Capitalist Order of the Liberal Market Economy and the Nature of Regulatory Capitalism

The capitalist economic model in the UK is described as an 'Anglo-liberal' economy²⁰ or as termed by the varieties of capitalism literature, a 'liberal market economy'.²¹ Fundamentally, a capitalist economic order upholds the freedom of exchange expressed in market relations, seen as the essential counterpart to political freedom in democratic states.²² Markets are regarded as places where individuals seeking to maximise their welfare can make efficient choices based on their individualistic perceptions of opportunity cost. The promotion of free markets can be seen as establishing the necessary conditions for realising economic freedoms and individual success.²³ The hallmark of the British model is the acceptance of the supremacy of the market in coordinating economic relations whether they are investment, production, distribution or consumption- a phenomenon some call 'market fundamentalism'.²⁴ Such market fundamentalism rose to its political peak in the 1980s under the Thatcher governments.²⁵ Although markets are not regarded as perfect and the development of law and regulation has played a part in addressing market distortions and failures,²⁶ the British model of capitalism today has continued to reflect many features of market fundamentalism.²⁷

The importance of marketization of economic relations has profoundly affected the organisation of economic activity in corporations. The corporate sector in Britain was dominated by monopolies

established under Royal Charter until the 19th century,²⁸ and family-owned and closely knit companies until the end of the First World War.²⁹ The organisation of economic activity within a corporate structure also had social and political implications.³⁰ The corporation ushered in an economic society in terms of structuring economic relations³¹ and bringing about social change such as social mobility.³² From the end of the Second World War, the marketization of the corporation developed incrementally with the rise in the market for corporate control and ownership of shares.³³ The promotion of market fundamentalism peaked with the dismantling of Keynesian economic policies in the 1980s, as the British state relinquished direct economic agency, privatised nationalised industries³⁴ and pursued a policy of enhancing corporate competitiveness. This era marked a decisive shift in the characterisation of British corporations as market-based actors, and has had a lasting effect upon corporate behaviour. Corporations as market-based actors pursue individualistic and 'rational' micro-economic behaviour, profoundly changing the way economic relationships are structured within and beyond the corporation,³⁵ and how they perceive their roles in society.³⁶ The Thatcher government promoted the structuring of economic relations through the market, and market supremacy trumped organised relations between firms and labour, marking the start of decline of the institution of collective bargaining.³⁷ Since the 1980s, government involvement in economic activity declined, and the private sector clearly came to the forefront to provide goods and services and carry out innovation.

Paradoxically, the state grew concomitantly in terms of its regulatory remit and apparatus.³⁸ It is a myth that systemic deregulation had taken place. Instead, this is an age of 'regulatory capitalism'.³⁹ Regulatory capitalism may be seen as the balance to market fundamentalism. The role of the state in economic policy is clarified as that of 'steering' while the private sector is responsible for 'rowing'.⁴⁰ The objectives of regulation are to steer away from the problems that unbridled markets give rise to, such as market failures⁴¹ and to provide collective goods.⁴² The nature of regulation has also become infused with economic analysis and market-based concepts.⁴³

⁴⁰ Above; Levi-Faur, 'The Global Diffusion' (2005).

⁴¹ Eg information asymmetry, oligopolistic structures etc, Anthony Ogus, *Regulation* (Oxford: Clarendon Press 1994); Bronwen Morgan and Karen Yeung, *An Introduction to Law and Regulation* (Cambridge: CUP 2007), pp18-25; 47-53.

The economically-driven model of regulation can be seen, for example, in the regulation of utilities⁴⁴ which focuses on anti-competitive behaviour, and in financial regulation⁴⁵ focused on overcoming market failures such as information asymmetries. The growth of many regulatory agencies⁴⁶ is premised upon the need to correct market failures so as to support optimal market outcomes. The government has since 2004 committed to better and efficient regulation,⁴⁷ including refraining from regulatory intervention in favour of 'economic progress'.⁴⁸

Policy-making and regulatory technique are infused with 'market-based' wisdom, as regulators consider the balance of risk/harm to determine the extent of intervention,⁴⁹ the need for regulatory resources to be allocated according to risk-based regulation,⁵⁰ and the use of cost-benefit analyses⁵¹ (however imperfectly⁵²) to account for regulatory initiatives.

Regulation has also been introduced to govern industries where business activity has resulted in social harms,⁵³ producing regulatory regimes that target a mixture of economic and social demands.⁵⁴ In sum, regulatory capitalism is heavily infused with the economic intellectual tradition, as economic behaviour and its control, become increasingly framed as incentive-based. Although this is not the only paradigm in which regulation is designed and implemented, regulatory capitalism

in the UK can on the whole be regarded as neo-liberal in nature,⁵⁵ supporting the marketised economic order.⁵⁶

The Three Tenets of Corporate Regulation

We argue that corporate regulation in the UK's liberal market economy is underpinned by the ethos in regulatory capitalism, giving rise to three tenets. First, the law for the organisation and structuring of corporations, company law, (a) respects corporations as private economic organisations; and (b) facilitates the economic freedoms of freely associating agents in the corporation as a 'contractarian organisation' that manages its internal efficiencies.⁵⁷ The role of mandatory law is to provide an efficient framework to meet the needs of order, balance and accountability in the private 'administrative' franchise that is the company.⁵⁸ Company law essentially constitutes a private framework of governance centred upon management control⁵⁹ subject to shareholder primacy.⁶⁰ This is consonant with the notions of theoretical efficiency supported by commentators⁶¹ in the economics of organisation. Company law has been shaped largely by internal efficiency and governance needs, bearing little relation to social policy.⁶² As the New Labour government put it in relation to reforming company law after they came into power, company law reforms carried out in 2006 were about modernising the company as a business vehicle that promotes enterprise and the right conditions for investment and employment.⁶³

Second, a major source of corporate regulation is securities regulation for publicly listed corporations. Such regulation is focused on corporations' responsibilities to the markets that provide them with capital, and facilitates market-based discipline carried out by investors. Securities

⁶³ DTI, *Company Law Reform White Paper* (2005), ch2, at <http://webarchive.nationalarchives.gov.uk/20060214052726/http://www.dti.gov.uk/cld/WhitePaper.htm>.

regulation was pioneered in the US as socio-economic reform,⁶⁴ but has since become characterised as chiefly economic in nature since the 1980s, as theoretical commentaries on securities regulation revolve around the efficiency of securities markets for securing investor protection.⁶⁵ Such a basis has also driven the development of EU (and UK) securities regulation,⁶⁶ culminating in major harmonisation reforms in the early millennium.⁶⁷

Securities regulation supports market-based discipline for publicly listed corporations by their investors, an important tenet in a well-functioning capital market. Investors could exercise their discipline by supporting a market for corporate control, as a means to change corporate management.⁶⁸ They could also choose to be activist and build up stakes in a company in order to exercise voice,⁶⁹ in the 'market for corporate influence'.⁷⁰ The marketization of investment relations between the company and shareholders has become the chief (and private) means for structuring the company's internal governance. Thus, when corporate scandals erupted in the early 1990s in relation to internal fraud and financial mis-reporting on securities markets,⁷¹ the key cure was seen to be investor discipline and scrutiny.⁷² The UK charted a regime of business-led soft law for the corporate governance of listed companies.⁷³ Best practices in corporate governance are now enshrined within a Code⁷⁴ that applies on a comply-or-explain basis to publicly traded companies.⁷⁵ The corporate governance of these companies is framed as a matter for shareholders to scrutinise,⁷⁶ neutralising the social ramifications of the scandals in question. This tradition has continued despite

⁶⁴ New Deal reforms after the Great Depression, Michael Parrish, *Securities Regulation and the New Deal* (Yale University Press, 1970). the findings of the Myners⁷⁷ and Walker Reports⁷⁸ relating to the relative passivity of institutional investors. Business and markets continue to support shareholder centrality in market discipline,⁷⁹ a position that policy-makers have been willing to endorse.⁸⁰ Investor primacy has brought about a marketised model profoundly shaping corporate governance, objectives⁸¹ and the nature of the corporation.⁸²

Nevertheless, 'business regulation' has been developed to effect economic or social policy that affect business or commercial activity.⁸³ These are often *externally*⁸⁴ addressed to corporations and other economic actors but do not intervene in the private spheres of corporate objectives or governance. For example, market failures such as mis-selling has led to a burst in global consumer protection regulation.⁸⁵ Product safety has been refined by private law in liability⁸⁶ as well as regulatory standards and enforcement,⁸⁷ extending to crucial areas such as food⁸⁸ and drugs,⁸⁹ especially in the wake of scandals such as the BSE scandal⁹⁰ and the thalidomide scandal.⁹¹ Although social protection against poor commercial practices underlies these regulatory reforms, such business regulation crucially supports market capitalism as consumer confidence is maintained.⁹²

Further, as the de-socialisation of labour-firm relations has taken place in the 1980s,⁹³ regulatory policy provides the necessary balances to inequalities in employment relationships not corrected by labour markets. Employee protection legislation developed in anti-discrimination, health and safety, minimum wage and other contractual rights.⁹⁴ Drahos and Braithwaite⁹⁵ also observe the rise in environmental protection legislation particularly in respect of clean air and water, as regulatory capitalism addresses the externalities caused by business activity. These reforms are a mixture of

social and economic policy, as corporations are forced to internalise the social price of their activities.

Although business regulation intervenes where markets do not work optimally, regulatory policy is highly shaped and influenced by business. In this political economy, corporations act as ‘business’ collectively, through trade associations⁹⁶ and international networks,⁹⁷ generating epistemic authority and lobbying pressure.⁹⁸ Dignam describes corporate law and securities regulation as shaped by a ‘negotiated’ regulatory framework between business and government.⁹⁹

The private and shareholder-focused nature of company law, investor-focused securities regulation and the expression of socio-economic policy through external regulation have become relatively ‘stable’ tenets of corporate regulation. These support (a) the neoliberal economic agenda, as states and business maintain a companion relationship of ‘steering’ and ‘rowing’, and (b) the liberal market economy where economic relations are incentive-based and marketised.

Deficiencies and Lacunae

As market-based actors in an economic model of market fundamentalism,¹⁰⁰ corporations’ have become insularly focused on profit-maximisation and securities market prices, characterised as ‘individualistic’ pursuits.¹⁰¹ The incentives for corporate behaviour tend to cause tensions with the needs of ‘collective’ good or social expectations. Regulatory capitalism has to an extent addressed harmful corporate conduct, but it tends to uphold a broad scope of economic freedom. Hence, regulatory capitalism is unlikely to address areas where conflicts arise between social expectations and corporations’ economic freedoms.

Corporations have marginalised the social and ethical dimensions of corporate behaviour not reflected in ‘market value’.¹⁰² Holistic notions such as the moderation of ‘self-interest’ by ‘moral sentiments’ of self-restraint,¹⁰³ or the perspective that a corporation creating economic wealth does so on trust for society¹⁰⁴ have become squeezed out by market fundamentalism. A profit-chasing culture in many financial firms generated perverse incentives towards excessive risk-taking,¹⁰⁵

culminating in the global financial crisis 2007-9, and also culminated in the scandal of fictitious bank accounts in Wells Fargo.¹⁰⁶ Many also regard the BP Deepwater Horizon disaster in 2010 as reflecting failures in organisational culture which prized cost-reduction over human safety.¹⁰⁷

Corporate exploits could often be at the expense of the social dimension, producing 'a-social' behaviour.¹⁰⁸ Further, Hendry gives an account of how market fundamentalism has made market values central to business operations, so corporations pursuing their business case are merely adhering to the *morality* of self-interest.¹⁰⁹ This conception of morality may conflict with human or social conceptions of morality,¹¹⁰ giving rise to a 'bimoral' space for negotiation by companies. The bifurcation of 'business morality' from human or social conceptions,¹¹¹ or indeed the marginalisation of the latter¹¹² could create a perverse organisational belief system that is morally dysfunctional.¹¹³

The private nature of corporate objectives does not necessarily engage with ethical or social dimensions. This is criticised as, at the very least the privilege of incorporation reflects a social contract on the basis of state enfranchisement of private activity.¹¹⁴ In the absence of regulatory moderation, corporations *can* adopt 'a-social' and 'bimoral' behaviour where there is a business case. This tendency is further exacerbated by global trends.

The rise in globalisation has been taken advantage of by corporations, bringing profound changes to their economic structures. Corporations now take advantage of multi-jurisdictional footprints and loose networks in contracts and organisation.¹¹⁵ Corporate behaviour has become less easy for national policy-makers to regulate,¹¹⁶ while the same policy-makers design regulatory regimes to compete in global regulatory competition¹¹⁷ even if strong and extra-territorial legislation can be effected.¹¹⁸ There is a lack of international law to govern multinational corporate behaviour,¹¹⁹ and

regulatory arbitrage¹²⁰ by corporations has flourished in the slow progress towards international harmonisation.¹²¹

In an 'a-social' paradigm, companies can pursue myopic and economically-driven relations with their constituents as long as financial efficiency is achieved. If employee-firm relations are insularly treated as marketised, issues such as wage justice would be down to contractual bargaining and are not framed as issues of 'social relations'. Further, stakeholders have found it challenging to advance their participation in the corporate law framework underpinned by shareholder primacy. For example, one of the hallmarks of the liberal market economy in the UK is an open market for corporate control. Companies are free to sell out to takeover offerors that meet with shareholder approval even if stakeholders such as employees and suppliers are affected and have no voice in such decisions.¹²² The marketised framing for corporate conduct crowds out social perspectives. UK companies are free to maintain low wages¹²³ while giving in to inflated executive compensation,¹²⁴ in accordance with the trends of different labour markets. A marketised framing of such disparities in reward would not allow us to compare apples to oranges in terms of the different wage markets. But a social framing of the disparities in reward would raise the query why the corporate profit pie, which is the product of all workers, should be distributed disproportionately to favour executives and management.

A marketised framing for corporate conduct and decisions can also tolerate certain amoral behaviour if private contracts have been entered 'freely' in the market. Sharp commercial practices that do not fall within consumer regulation may be pursued putting suppliers on insecure terms.¹²⁵ The case of *Newton-Sealey v ArmorGroup Services Ltd & Ors*¹²⁶ illustrates how the legality of a contractual arrangement has become disengaged with any sense of social justice. In that case, a retired army officer in the UK was recruited to provide risky security services in a post-conflict zone in Iraq. The contract was framed to be between the Group's Jersey company and the individual, as the Jersey company could exclude liability for negligence in causing personal injury or death. Although UK law outlaws such exclusion clauses, the individual was subject to less protection under Jersey law, the choice of law made possible for the corporation due to its multi-jurisdictional footprint. The individual who was ultimately injured while on duty could not obtain any compensation from the Jersey or the UK parent company. The legitimacy, albeit sharpness of the commercial practice of limiting business risks for the parent company was upheld, as the parent company was free to organise its economic relations and business risks within the available company law framework.

By maintaining the private and business-focused nature of corporate law, the company can remain impervious to distributional issues while governments face limitations in effecting distributional justice. The liberal market economy is a capitalist order apt to produce distributive inequalities.¹²⁷ Although such inequalities reflect differences in reward for different forms of enterprise or economic behaviour,¹²⁸ it is another matter to merely accept significantly high levels of inequality that have come about in neo-liberal, financialised economies such as the US and UK.¹²⁹ For example, the company is free to recalibrate pension schemes to the financial disadvantage of employees, such as by paying out dividends to shareholders while pension deficits exist.¹³⁰ These loci of distributional injustices are now attracting policy attention, as Section B discusses.¹³¹ Market primacy cannot address such inequalities as market prices are often flawed and do not perfectly reflect social cost.¹³² For example, in the *Newton-Sealey* case, the wages paid to the employee arguably do not fully internalise the risks to the individual and his family.

It is arguable that the very social good of having corporate forms organise productive economic activity is itself becoming questionable. This problem is explored in Kay's review¹³³ undertaken for the British government with regard to how long-termism, i.e. the social good of corporate wealth creation for all economic stakeholders in the long term) is being undermined by stock market short-termism.¹³⁴ As investors 'discipline' corporations by exit or voice depending on quarterly corporate performance, corporate strategies become attuned to the short-term and are financially-driven, undermining visions and strategic investment for the long-term.¹³⁵

The three tenets of corporate regulation are most sharply felt where social objectives are in conflict with market-based incentives. By leaving markets to achieve their allocative purposes, governments have a limited arsenal in addressing social inequalities or bimoral (but legal) behaviour perpetuated

by the corporate sector. Bruner¹³⁶ argues that the essentially private, shareholder-centric model of company law is legitimate in the UK as social concerns are addressed by the welfare state and social policy regulations, leaving it free for corporate law and governance to serve the needs of the company's private economic enterprise. The government's ability to use fiscal and welfare state measures has become increasingly limited due to the austerity measures imposed after the global financial crisis.¹³⁷ The lacunae and deficiencies of corporate regulation are being exposed for not significantly moderating 'a-social' and 'bimoral' behaviour on the part of corporations.¹³⁸

Section B now turns to the drivers that challenge the stability of regulatory capitalism.

B. Regulatory Capitalism Challenged

In this Section we argue that two major drivers exert pressure towards shifts in the tenets of regulatory capitalism. First the rise of voices that articulate perspectives on 'corporate social responsibility' (CSR), influencing policy and law for corporations. Second, the onset of the global financial crisis 2007-9 has introduced political disruptions that have had aftershock effects upon corporate regulation and reform.

The Rise of Transnational Private Governance, Multi-stakeholder Initiatives and New Governance

Civil society forces, such as the rise of non-governmental organisations (NGOs),¹³⁹ have assumed an increasingly important voice in articulating the need for corporations, particularly multinational corporations, to assume responsibility commensurate with their social power and footprint¹⁴⁰ and the need for them to act as 'social citizens' beyond legal compliance.¹⁴¹ Even as MNCs introduce investment and economic opportunities, they also exploit resources and externalise social harm.¹⁴² Civil society voices have arisen in the transnational sphere where there is a lack of global corporate regulation or extra-territorial regulation by nation states.¹⁴³

In this transnational space, a variety of actors offer voice, both critical and constructive, as well as pro-active initiatives to influence corporate behaviour. The space is first dominated by states, international organisations, networks of regulators and industry associations,¹⁴⁴ but increasingly populated by third-party standard-setting bodies, civil society organisations, NGOs, forming a polycentric space¹⁴⁵ for governance. Technological modernisation also facilitates social organisation, communications and cooperation for such common causes. In this space, various voluntary initiatives have been developed to secure corporate commitment to initiatives such as agenda-setting for policy change, standard-setting for products, services or conduct,¹⁴⁶ labelling or certification of organisations or their output,¹⁴⁷ audit, procedural governance¹⁴⁸ and dialogic mechanisms.¹⁴⁹ As many initiatives differ from traditional regulatory law in terms of the nature of 'obligation' imposed, the 'precision' and 'enforcement' of such obligation,¹⁵⁰ they are characterised as 'soft law'. Soft law typically mimicks but does not fully attain the traditional characteristics of state-based regulation.¹⁵¹ Many commentators have increasingly called upon the recognition of this body of soft law as 'transnational private regulation',¹⁵² consolidating its 'lawness' as a pluralist phenomenon,¹⁵³ so that its causes may not be obstructed by traditional frames for law and legality.¹⁵⁴

The polycentric governance space and 'soft law' instruments for securing change in corporate behaviour constitute a 'transnational' new governance,¹⁵⁵ characterised by diversity, inclusiveness, participation, interrelationships¹⁵⁶ and the socialisation of the corporation within this fabric.¹⁵⁷ In this manner, firm insularity can be opened up, and corporate accountability may be multi-channelled,¹⁵⁸ instead of narrowly focusing on markets and investors. There is increasing recognition of the potency of such bottom-up pressures.¹⁵⁹ Civil society groups have successfully become part of many multi-stakeholder initiatives that shape corporate behaviour,¹⁶⁰ albeit in an essentially contested space for governance.

Such institutional movements have been keenly noted by business. Concomitantly, businesses have also participated in the conceptualisation of CSR in order to frame it towards their interest.¹⁶¹ This conceptual stalemate¹⁶² is reflected in a 'governance' or political stalemate,¹⁶³ as neither social forces nor business have fully captured the definition of CSR.¹⁶⁴ Businesses have sought to characterise CSR as being consistent with the business case, whether financially-defined¹⁶⁵ or

The claim to institutional change, though observed, is slow. Further, the polycentric governance space is far from harmonious, ridden with contests in ideology, values, power and methodology. Civil society organisations, NGOs and other socially-led groups face conflicts of interests¹⁷⁹ and do not have consonant voices nor common agendas with each other or with state-led international organisations¹⁸⁰ and corporate-led industry associations. There is a lack of clear authoritative or coordinative order in this governance space and the flourishing of myriad forms of soft law have not always translated into roadmaps for empirical implementation of changes to corporate behaviour.

Mixed Achievements Observed in the UK

The emerging nature of transnational governance has produced incremental institutional shifts. In the UK, corporations are increasingly attuned to 'social responsibility' concerns, but these are predominantly framed in terms of business 'risk' in relation to reputation and 'performance'. Hence, policy-makers introducing company law reforms in 2006 accept that a directors' duty to secure the 'success' of the company for the benefit of shareholders as a whole *includes* a duty to take into account of relevant stakeholder-facing and social responsibility matters.¹⁸¹ Investors are particularly called upon to consider 'environment, social and governance' (ESG) matters, aligning social expectations with their own interests.¹⁸² There is pronounced reliance on investor and market discipline for corporations' 'ESG' profiles,¹⁸³ but we cannot blithely assume that investors act on behalf of enforcing social expectations or behave as social gatekeepers.¹⁸⁴ The focus on the marketised framing for CSR has the potential to undermine the content of social demand in CSR. The marketised framing also has the effect of confining CSR to voluntary and self-regulatory measures, as legalisation may be regarded as inappropriate interventions into the 'market for virtue'.¹⁸⁵

Policy-makers in the UK have been slow to consider regulatory policy in CSR, relying on corporate self-regulation and investor leadership to address corporate behaviour. The agnosticism of

regulators is an important reason for the slowness of institutional change. However, policy-makers have become interested in the innovative 'new governance' methodologies in many soft law initiatives. Such techniques seem to offer innovative and possible cost-reducing ways of introducing corporate regulation where warranted.

'New governance' methodologies are based on multi-stakeholder governance to change corporate behaviour.¹⁸⁶ It is envisaged that the regulated subject ie the corporation would be subject to regulatory principles that incorporate more procedural flexibility, and work with a variety of 'governance' actors including regulators, markets and stakeholders in securing compliance,¹⁸⁷ potentially overcoming the short-comings of traditional command-and-control regulation. In the UK, this was accepted by financial regulators (in line with international regulatory developments)¹⁸⁸ in the area of regulating risk management by banks. Further, we also saw this implemented in the Corporate Homicide and Manslaughter Act 2007.

The implementation of new governance techniques in financial regulation has however resulted in spectacular regulatory failure in the global financial crisis 2007-9. This is largely because 'new governance' techniques were not implemented incorporating the multi-stakeholder ethos, and focused on investors and securities markets as governance actors. These have failed to exercise meaningful discipline,¹⁸⁹ resulting in banks being in fact devolved with self-regulation. Banks manipulated the 'flexible' regulatory standards to their advantage, and were relatively unchecked.¹⁹⁰

Lacklustre implementation of 'new governance' techniques in the UK can also be seen in the Corporate Homicide and Manslaughter Act 2007. The Act progressed through a long period of gestation since policy reform recommended by the Law Commission in 1996¹⁹¹ after a number of fatal industrial accidents between 1986-9.¹⁹² Amidst political challenges to the policy change, the Law Commission's report was not taken up until 2000 after the New Labour government came to power. The Act is ultimately passed in 2007 to introduce a corporate manslaughter offence for public and private corporate bodies that cause death due to a gross breach of a duty of care to the victim/s, attributed to the way the organisation is managed or organised.¹⁹³ The reform overcomes the limitations in case law which sought to attribute corporate liability to certain the minds and wills of certain individuals in corporations¹⁹⁴ The new regulatory technique seems able to interrogate the 'inside' of the corporation in terms of poor management or organisation that results in harmful

externally-facing conduct.¹⁹⁵ This reform arguably connects a corporation's management to the prevention of social harm, introducing a form of disruption to the insular and economically-driven model of the corporation and its governance.¹⁹⁶

The adoption of 'new governance' techniques in the Act has not introduced profound changes to corporate behaviour. First, the corporation remains 'free' to determine its internal management and systems and the regulatory regime does not involve social or stakeholder scrutiny into corporate behaviour on an *ex ante* basis. Second, the corporation is only called to account for its internal management and systems before the court when indicted for the occurrence of 'corporate homicide or manslaughter'. The judicial interrogation of internal management and systems is *ex post* in nature and has focused on precise pinpointing of senior management negligence.¹⁹⁷ This narrow approach makes it difficult to pin liability upon large organisations with diffuse responsibility within.¹⁹⁸

The achievements in regulatory policy in addressing the social dimensions of corporate behaviour have been relatively incremental before the onset of the global financial crisis 2007-9. The crisis and its aftermath has provided new opportunities for challenges to the stability of regulatory capitalism, culminating in the recent surge in legalisation of CSR issues discussed in Section C.

Regulatory Capitalism Challenged by Global Financial Crisis and its Aftermath

The global financial crisis 2007-9 saw the near failure of a number of US, UK and European banks that had taken excessive risks. Many were exposed to liquidity risks not prudently managed,¹⁹⁹ or solvency risk due to holdings of complex (and ultimately toxic) securitised assets on their balance sheets.²⁰⁰ The marketised financial economy promotes herding in good times and excessive withdrawals in bad times,²⁰¹ exacerbating stresses already faced by financial firms.²⁰² As financialisation has brought about a state of private sector dominance in meeting the financial needs of states, business and households,²⁰³ many states found themselves in a position of having to bail out significant financial institutions in order to prevent the collapse of domestic financial systems.²⁰⁴ The crisis led to real economic damage, such as lost homes and jobs, and adversely affected the fiscal strength of governments, resulting in widespread austerity measures in the EU and UK, and a

loss of welfare.²⁰⁵ Social confidence in market capitalism in the UK has been severely disturbed,²⁰⁶ as reflected in (a) articulations of the ideological crisis of faith in the UK's capitalist model; and (b) political disruptions in the UK echoed across many other European countries.

The ideological crisis of faith in market capitalism has been expressed in intellectual calls to challenge the current model of market capitalism, in order to adjust towards an economic model more cognisant of the social needs for justice and stability.²⁰⁷ These voices reflect a culmination of underlying concerns that have built up for years in the UK economy- issues such as widening inequalities between the economic elite and ordinary citizenry, the stagnation of wages compared to profits made from financial capital²⁰⁸ and the marginalisation of stakeholders from business and policy.²⁰⁹ Indeed the 'Occupy' movement worldwide was a reflection of social discontent that has arisen to challenge the legitimacy of the capitalist model of market fundamentalism which has perpetuated social inequalities and divisions.²¹⁰ This ideological crisis has not become revolutionary with worldwide crackdown of the Occupy movement. But policy-makers cognisant of the failings of financial markets sought to appease the public with international resolve²¹¹ to regulate banks and financial institutions more robustly. The determination in the US to bring the Dodd-Frank Act 2010 into force, and the comprehensive programme of institutional and regulatory reform in the EU²¹² and UK,²¹³ which changed regulatory paradigms significantly,²¹⁴ have found social resonance. This shift has not dethroned the private financial sector from continuing to be dominant in mediating worldwide financial needs for states, businesses and households,²¹⁵ but a social truce seems to have been attained by the force of regulation asserting a new balance of power and legitimacy in the financialised market economy. The re-regulatory high in the aftermath of the global financial crisis 2007-9 is an important context for the increased legalisation of CSR to change corporate behaviour

more generally.²¹⁶ This trend is not limited to although pronounced in the EU and UK.²¹⁷ At an international level, a similar appetite for the legalisation of CSR, such as in business and human rights, anti-bribery etc can also be detected.²¹⁸

In the UK, the continuing motivation towards legalisation of CSR is also attributable to the sharpened political need to respond to social demand. Political sensitivity is sharpened towards social demand as the UK continues to experience political disruption that has followed from the global financial crisis. Instability in the consolidation of political power amongst major parties in the UK has intruded upon business-government relations, now in a more turbulent phase.

The New Labour government was ousted from power in the 2010 election following political mistakes made by the incumbent government defending the economic status quo.²¹⁹ A coalition government was formed in the wake of a lack of parliamentary majority, between the Conservatives and Liberal Democrats, which oversaw most of the immediate post-crisis reforms and a period of austerity measures. Social sentiment has remained unstable as greater polarisation between the political right and left grew,²²⁰ and far-right elements have garnered a louder voice in political representation.²²¹ The subsequent Conservative bare majority governments²²² have been weak and besieged by divisions in social demand and opinions. The UK is experiencing a period of political instability such as highlighted in the highly divided Brexit referendum in 2016 and its continuing ramifications. Social discontent leading to political disruption is also played out in the UK's European neighbours, some of which are a response to the social fallout from austerity measures,²²³ and some of which reflect a social cry for paradigm shift and change in policy.²²⁴

In this landscape, holders of political power have turned to regulation²²⁵ to address many aspects of social discontent, especially *vis a vis* business. Such socially-facing regulation of business could placate voters, but they inevitably cause a shift in business-government relations. Could the current wave of legalisation in CSR matters signal a fundamental institutional shift in the tenets of regulatory capitalism, bridging the economically-driven and market-focused corporation with its ethical and social dimensions? Has the new legalisation ultimately 'hardened' the soft law of socially-driven initiatives? We turn to analyse the key reforms in Section C.

C. Post-Crisis Legalisation of CSR

The corporate regulation reforms discussed in this Section could mark a significant institutional shift, as various 'socially-facing' aspects of corporate behaviour seem no longer to be left in the realm of soft law and self-regulation, but have found a place in regulatory law. This however does not mean that regulatory law embodies the substantive norms of conduct, or implementation and enforcement that reflect the nature of social demand. Crucially, 'new governance' techniques have again been brought in to effect such reforms. On the one hand, 'new governance' techniques embody a new ethos in corporations' governance relationships with stakeholders and not just the regulator/state. The employment of such techniques could mark a shift towards changing the nature of corporate regulation, allowing multi-stakeholderism and more social infusion into corporate regulation. On the other hand, 'new governance' techniques can also empower internal self-regulation by corporations, and are susceptible to devolution to corporates without due monitoring and accountability, as has occurred in the pre-crisis years. We observe that 'new governance' techniques have been employed in two key ways across a number of different regulatory reforms.

One technique extends corporate transparency to socially-facing issues and seems to invigorate securities markets as well as broader society in new roles of governance. We discuss the examples of the EU Non-financial disclosure Directive 2014 and the UK's Modern Slavery Act 2015. The other technique employs the 'new governance' approach of interrogating the inside of a corporation to enhance responsibility for preventing misconduct. These are: in relation to conflict minerals due diligence (EU Conflict Minerals Regulation 2017); bribery (Bribery Act 2010); tax evasion (Criminal Finances Act 2017) and the general enhancement of stakeholder voice in corporations (the UK's Business Energy and Industrial Strategy (BEIS) Department's reforms).

The achievements and limitations of recent corporate regulation reforms will be fleshed out by our analysis of the advancements (or otherwise) made by the employment of 'new governance' techniques. 'New governance' has the potential to challenge the economic insularity of corporate governance and objectives, and compel a form of socialisation of the corporation. However the very flexibility and malleability of 'new governance' techniques can be moulded to limit their challenge to the tenets of regulatory capitalism. 'Strong' forms of implementation of certain corporate regulation reforms *could* be adopted that bring about more profound paradigm shifts in the nature of corporate regulation in the UK, but these are ultimately not achieved. Instead the implementation in the UK continues to be shaped by the tenets of regulatory capitalism.

Strong versus Weak Forms of 'New Governance' Implementation

'Strong' forms of implementation of the recent corporate regulation reforms can signal decisive shifts away from the tenets of regulatory capitalism. Such implementation could promote the ethos of 'new governance' techniques in terms of infusing corporate objectives with social and ethical underpinnings, and promoting greater engagement between corporations with stakeholders in various formalised multi-stakeholder approaches in securing corporate compliance.²²⁶ These shifts would represent change from the market fundamentalist paradigms of corporate behaviour, as actors in governance could be non-market in nature, and social values may be elevated and not marginalised by 'market' values. We regard one or more of the following as representing a marked shift in corporate behaviour: re-orienting corporate objectives towards commitment to address CSR problems, re-orienting internal management and structures towards new ethics for supporting social

²²⁶ Multi-stakeholder initiatives see n160.

objectives, re-positioning corporate accountability towards a wide range of stakeholders, and the adoption of new, collaborative or pluralistic techniques of governance *by* the corporation.

On the contrary, weak forms of implementation would likely effect less marked or no departure from the tenets of regulatory capitalism. This could mean a continued subscription to the importance of incentive-based behaviour and market discipline, and limited or no adoption of multi-stakeholderism. Further, 'new governance' techniques that interrogate internal management structures, governance or procedures can be devolved to corporations and reduced to proceduralisation. Corporations can superficially adopt procedures or manipulate them to instrumental purposes, culminating in a form of 'organised hypocrisy'²²⁷ that does not really touch corporate culture.²²⁸ It has been observed that the deliberate promotion of multi-stakeholder governance in environmental governance has been unique and successful, a trend not replicated in other areas of CSR.²²⁹ Corporations devolved to interpret new governance reforms may manipulate regulatory freedoms in a calculative manner that does not attain social expectations, undermining the ethos of 'new governance' itself.

We first discuss the employment of 'new governance' techniques in interrogating internal management and procedures at corporations to combat bribery and tax evasion. Next, we discuss the use of these techniques, albeit in a more limited way, in addressing supply chain governance by corporations. Third, we turn to reforms based on corporate disclosure of CSR issues. Finally, we discuss the UK's reforms to improve stakeholder engagement with companies.

(a) Enhancing Internal Interrogation into Corporations

We first examine the Bribery Act 2010 and Criminal Finances Act 2017 to assess the UK's legislative efforts intervening into the internal organisation of corporations in order to change corporate behaviour 'from within'. Under both pieces of legislation, corporations are obliged to institute reasonable or adequate procedures in order to *prevent* bribery or tax evasion. This form of *ex ante* phrasing is different from *ex post* enforcement against acts of bribery and tax evasion. The obligation to *prevent* emphasises ongoing efforts and is aimed to change 'the way things are done' in the corporation via the introduction of a form of procedural regulation.

The Bribery Act 2010 introduces criminal liability for a corporation that fails to prevent bribery by any person associated with it in order to retain business or an advantage for the corporation.²³⁰ The corporation can only avoid liability if it has in place adequate procedures²³¹ designed to prevent such conduct. Anti-bribery regulation delineates corporations' responsibility to prevent bribery even if they operate in a complex web of external institutional and cultural factors that demand corrupt payments.²³² The Criminal Finances Act 2017 introduces for corporations an offence for failure to

prevent tax evasion facilitated by a person associated with the corporation, whether such tax evasion is in relation to a liability to pay UK or foreign tax. The corporation can only avoid liability if it has put in place prevention procedures that are reasonable to be instituted. It is arguably a bold step for both Acts to impose criminal liability on corporations for 'failure to prevent', signalling the need for corporations to proactively look into their internal organisation, procedures and incentives in order to avoid liability.

In terms of substantive norms, anti-bribery norms have been enhanced in the Bribery Act while anti-tax evasion norms have been incrementally developed in other pieces of legislation.²³³ The Bribery Act has adopted an expansive definition of bribery,²³⁴ avoiding the route taken by the US Foreign Corrupt Practices Act whose exceptions to the definition of bribery reflect the capture of business interests.²³⁵ The Act has arguably achieved an unequivocal pronouncement on the social unacceptability of bribery²³⁶ after a protracted policy process challenged by business resistance.²³⁷ Under the Criminal Finances Act, 'tax evasion' is defined as 'cheating the public revenue' or 'knowingly engaged in a fraudulent scheme to evade tax'²³⁸ and in relation to foreign taxes, relates to committing a tax evasion offence or breach of duty under foreign law.²³⁹ The illegal tax behaviour captured relates to precise norms of behaviour such as deceptive under-declaration or falsification of information so that tax liability is assessed incorrectly, but will also include tax avoidance behaviour that is established as 'abusive'. As Wolff points out,²⁴⁰ there is relatively minimal tax evasion by corporations, especially by multinational corporations whose financial transparency is heavily regulated, leaving little room for tax evasion.²⁴¹ The increasing social outcry against corporate tax behaviour relates to *tax avoidance*²⁴² or aggressive forms of it, i.e. legal structures and schemes that may appear to be complex and contrived, in order to minimise a corporation's tax burdens.²⁴³

Commentators have discussed how globalisation and easy access to low tax jurisdictions have greatly facilitated tax avoidance schemes for many multi-nationals, such as the use of transfer

pricing schemes within the same group of companies,²⁴⁴ the use of offshore companies incorporated in tax havens to hold corporate assets or licences so that revenues are regarded to be earned offshore and subject to minimal tax.²⁴⁵ One of the most oft-cited examples is the 'double Irish Dutch sandwich' scheme used by Google to avoid paying corporate tax in the US.²⁴⁶ Although the ethicality of paying tax is not an absolute one,²⁴⁷ and one can take the view that tax laws are rules-based in nature,²⁴⁸ not representing fundamental norms or values such as compared to the protection of human rights or anti-corruption, the social offensiveness of aggressive corporate tax avoidance is not unfounded. Zucman²⁴⁹ argues that aggressive corporate tax avoidance has to date deprived most treasuries of 20% of their corporate tax receipts, which form a-third of most developed jurisdictions' revenues. Even if the net effect is a 6% loss in overall tax receipts by governments, this can impact upon public services, the deterioration of which is a major source of social discontent.²⁵⁰ Further, the loss of tax receipts could mean that governments have to borrow more and impose the fiscal burden upon ordinary citizens. Although some have argued that corporations, especially multinational ones, do not benefit from state provision of services or welfare and hence should not be asked to pay taxes to fund state expenditure,²⁵¹ this argument only goes to reflect the insularity of the economically-driven globalised corporation which has no sense of citizenship or common burden-sharing with its communities.²⁵² Many commentators see the need for corporations to be responsible in the relative ethicality of their tax behaviour, especially in light of their resourcefulness as compared to ordinary individuals.²⁵³

Tax behaviour has come under substantive reform since 2013. Until the passage of the Finance Act 2013, there is no 'general anti-avoidance rule'²⁵⁴ in the UK. Tax law has been reformed to allow the HMRC to challenge 'tax abuse' arrangements²⁵⁵ by referring to a panel whose advisory opinion is to be recognised in court.²⁵⁶ Abusive tax behaviour is based on a 'double reasonableness' test that no reasonable person would regard the arrangement as a reasonable course of action, except to

facilitate tax avoidance.²⁵⁷ Although a major step towards a general anti-avoidance rule, some commentators argue that the UK's approach falls slightly short.²⁵⁸ However, the EU Anti-Avoidance Directive 2016, yet to be fully implemented by Member States, likely combats many instances of corporate tax avoidance and provides a general anti-avoidance rule. The Directive looks set to develop substantive norms in unacceptable tax behaviour more widely in an unprecedented manner.²⁵⁹ Full implementation in the UK is however uncertain given the impending Brexit.²⁶⁰ In sum, there is a movement towards reforming tax behaviour norms but the full extent of these achievements remains to be seen.

Although key achievements in norm advancement have been attained in anti-bribery and anti-tax evasion, changes in corporate culture need to be achieved by both robust enforcement and *ex ante* corporate internalisation. We critically query whether the 'new governance' techniques to effect the 'responsibility to prevent' would result in mere devolution to corporations to institute internal procedures that are opaque to stakeholder and public accountability. This could undermine the ethos and potential of 'new governance' techniques, rendering the obligation to 'prevent' merely rhetorical, as the only meaningful enforcement would be *ex post* in nature.

First, we observe that the obligation to institute procedures under both Acts are in accordance with broad guidelines issued by the relevant government departments. The Ministry of Justice has issued procedural guidance in the manner of 6 broad principles to supplement the Bribery Act.²⁶¹ A similar approach of Ministerial guidance is adopted in relation to the Criminal Finances Act. These guidances outline broad principles and corporations can use these as a basis for designing tailor-made changes to corporate operations or procedures. However, procedural or organisational reforms penetrate at different levels and need not show fundamental change. The resolve to change could reflect the corporation's incentives to manage the commercial impact of compliance or could reflect more normative embrace of social and public interest expectations. The premise for change affects the design of procedures including reforming leadership commitment, key business and operations processes, risk management and internal control.²⁶² Procedural changes can also be less penetrative and more superficial, if designed merely to minimise legal risk while avoiding significant changes to the conduct of business. Procedural changes can be task-oriented such as multiplying documented channels,²⁶³ and one could remain sceptical as to real engagement with ethics, values²⁶⁴ or organisational culture.²⁶⁵

The Acts have arguably devolved to corporations to determine their internal organisation and reform of procedures, as corporations are only required to introduce procedures where ‘reasonable’ and they remain the judge of what is ‘reasonable’ on an *ex ante* basis (although they have the burden to prove that their determination was correct). Although the Acts employ ‘new governance’ techniques, the essential ‘new governance’ ethos of enrolling multi-stakeholder governance is not pursued.²⁶⁶ Leaving corporations to implement their new compliance may render such post-crisis ‘new governance’ techniques again susceptible to the same pre-crisis problems discussed in Section B. LeBaron and Rühmkorf²⁶⁷ in an empirical study of the implementation of the Bribery Act 2010 find that many corporations have visibly changed their internal procedures and the terms and manner in which they conduct external relationships. These findings show that an extent of disruptive change has occurred from the ‘inside’ of corporations. However as this study did not engage with interviews with corporations, it does not shed light on whether procedural changes in written policies have deeply penetrated corporate culture and ethics.

The Serious Fraud Office’s (SFO) enforcement of the Bribery Act against Rolls Royce in 2017 also sheds light on the extent to which ‘new governance’ regulatory techniques have really changed the nature of corporate regulation. In order to avoid prosecution for bribery carried out in China, Indonesia and a number of other countries, Rolls Royce agreed to appoint Lord Gold to monitor its internal procedural reform to *prevent* bribery in the future. Such monitoring and review is reported periodically to the SFO.²⁶⁸ The deferred prosecution agreement shows a preference for devolution to corporations to institute appropriate procedures, subject to a privatised form of monitoring by an expert.

Privatised implementation of corporate compliance can result in ‘legal endogeneity’²⁶⁹ (which refers to the self-legitimizing effect of corporations’ implementation of their own procedures and systems, resulting in *de facto* self-regulation). Under such an approach, how corporations deal with their ethical and compliance dilemmas remains opaque. In the wider context of global competition and temptations from tax havens, or the difficult contexts of doing business in corrupt jurisdictions, ethical dilemmas abound²⁷⁰ and there is social interest in scrutinising that corporate decisions do not compromise social objectives. The ‘new governance’ approach in the Bribery Act as enforced by the SFO has framed the governance space as revolving around the regulator and regulated, leaving little space for public and stakeholder scrutiny. We critically question why multi-stakeholder governance is not attempted. For example, Transparency International has developed a Checklist that

systematically directs companies to establish policies and management processes that would meet the broadly-worded procedural requirements in the Bribery Act and MOJ Guidance.²⁷¹ Such a player could usefully act as part of an independent monitoring group for deferred prosecution arrangements. Multi-stakeholder governance may be resisted by business on the basis of commercial sensitivity but obligations of confidentiality and safeguards can be imposed.²⁷²

It may however be argued that multi-stakeholder governance is not the only means of securing corporate behavioural change. Indeed in the UK, there is a strong movement towards securing corporate culture and behavioural change in the banking sector after the global financial crisis 2007-9,²⁷³ and these efforts are very much aimed at empowering regulators against the regulated, not co-opting a wider scope of governance capacity. Regulatory enforcement and scrutiny can prevent legal endogeneity. However, the opacity in the regulator-regulated relationship can make regulatory efficacy an inscrutable matter, including obscuring any dangerous elements of regulatory capture or sympathy²⁷⁴ for the industry. For example, Wells²⁷⁵ criticises the SFO in its forbearance from enforcement where it felt constrained by fears that sanctions would damage the firm's viability.²⁷⁶ Further, the unique approach in financial regulation can in part be explained by the technical (and quantitative) nature of regulatory obligations,²⁷⁷ which stakeholders may find hard to scrutinise. Where social objectives underpin corporate regulation such as in anti-bribery, multi-stakeholder governance such as enrolling a panel of third-party bodies for engagement, feedback or even inspections, should be considered, as such can powerfully influence corporate consciousness and culture.²⁷⁸

(b) Addressing Supply Chain Governance

Globalisation and international trade has liberalised opportunities for worldwide sourcing, production and distribution of goods and services, but also brought about opportunities for exploitation of resources and labour.²⁷⁹ Global sourcing can lead to fuelling regional conflicts over control of resources like oil and minerals, and exploitation of human beings in search of economic

opportunities,²⁸⁰ such as through human trafficking, modern forms of slavery and abject labour conditions.²⁸¹ Whether or not corporations are directly complicit in armed gangs' or gangmasters' evil exploits, they have to an extent been able to take advantage of cost advantages, by outsourcing and procuring on the basis of their global buying power.²⁸² The abuses in such exploitation have been brought to light by the determined efforts of civil and non-governmental organisations, highlighting the pernicious effects of corporate indifference to the negative externalities in their supply chains.

UK and EU legislation have now started to address issues in the supply chain, after decades of soft law initiatives in the transnational sphere. These are in relation to the importation of conflict minerals,²⁸³ human trafficking and modern slavery²⁸⁴ (UK) and more generally, the protection of human rights.²⁸⁵

'New governance' techniques are employed in regulatory reforms, but they largely devolve supply chain governance to corporations themselves. To different extents in the Conflict Minerals Regulation 2017, the UK Modern Slavery Act 2015 and the non-financial disclosure of human rights impact under the EU Non-financial Disclosure Directive 2014, the corporation is expected to manage their supply chains based on their implementation of 'due diligence'. The Conflict Minerals Regulation imposes direct due diligence obligations but the Modern Slavery Act and EU Non-financial Disclosure Directive only require companies to disclose procedural aspects of supply chain governance.

First, it is noted that regulation has avoided articulating particular substantive norms, such as liability for sourcing conflict minerals or using trafficked labour or modern slaves in the supply chain. This is because the regulatory reforms avoid introducing 'outcomes' to be attained in terms of the desired social changes. It is argued that introducing bans for conflict minerals would result in an indiscriminate blow to legitimate economic activity in developing regions,²⁸⁶ hence substantive norms of conduct need to be considered carefully for unintended consequences. Under the Modern Slavery Act, it is a criminal offence for anyone to hold or require the performance of slave or compulsory labour.²⁸⁷ Unless a corporation is engaged in such practices, such as the abusive and illegal employment practices at SportsDirect which became the subject of a Parliament Inquiry,²⁸⁸ the criminal offence is unlikely to attach to a multinational corporation for practices occurring in its supply chain. There is also little prospect of the availability of tort class actions by victims of modern

slavery in supply chains against the foreign multinational.²⁸⁹ It may be argued that corporations maintain different levels of leveraging power over their supply chains²⁹⁰ and an excessively high level of responsibility may be impracticable. However, soft law and transnational governance seem to have achieved more in introducing ‘outcomes’-based norms, such as the Responsible Business Alliance’s code of conduct for the electronics industry setting out extensive norms for humane employment conditions within the supply chain.²⁹¹ Compared to norm advancement in anti-bribery and tax evasion, it is questioned why similar norms to ‘prevent’ the outcomes of suffering for individuals, or a form of joint or contributory liability for supply chain misconduct are not instituted. Such norm changes would have profound implications for multinationals in managing legal risk.²⁹²

The regulatory reforms focus on procedural governance, in the vein of ‘new governance’ techniques. The Conflict Minerals Regulation²⁹³ imposes due diligence obligations on importers of tin, tungsten, tantalum and gold. Importers also need to obtain third-party certification of compliance and make public disclosure on a yearly basis.²⁹⁴ However, these obligations are imposed on a narrow group of direct importers of the minerals into the EU.²⁹⁵ If EU corporations produce output with these minerals sourced at some stage outside of the EU, they are not obliged to comply.²⁹⁶

In the absence of substantive norms that change corporate objectives or conduct, can the fulfilment of due diligence improve corporations’ ethical considerations of being a good ‘citizen’ in conflict-ridden and fragile jurisdictions? It is questioned why a more precise substantive norm to require sourcing from conflict-free smelters cannot be legalised.²⁹⁷ The due diligence obligations to trace sources and undertake risk management are essentially devolved to corporations as a form of contractual management within its supply chain.²⁹⁸ In analysing the American counterpart to governing conflict minerals,²⁹⁹ commentators observe weak and cosmetic due diligence procedures and a general corporate indifference to their impact on fragile jurisdictions.³⁰⁰ In the absence of stronger substantive norms of outcomes or conduct, corporations’ socially-facing motivations may conflict with their calculative and ‘bimoral’ tensions.³⁰¹ These underlie the main hazards in devolving

to corporations to manage the socially-facing issues in the commercial context of their supply-chain relations.

Third-party certification can however work as a form of gate-keeping under the Conflict Minerals Regulation. The certification has the potential to hold corporations accountable for their due diligence so that superficial compliance is avoided, adding implicit pressure for behaviour change. Existing players in the industry for certification services include the Conflict-free Smelter Programme, which can be expected to gain more formal recognition. Would certification be merely technical in nature, and would it take into account of the social justice footprint of the minerals trade? The Regulation comes into force in 2021, and developments should be watched.

On mandatory disclosure under the Modern Slavery Act and EU Non-financial Disclosure Directive, corporations are subject to a principally devolved and non-standardised implementation of due diligence.

Under section 54 of the Modern Slavery Act, certain commercial organisations³⁰² must make mandatory disclosure yearly of a 'slavery and human trafficking statement' (the Statement) in order to provide transparency on the steps that a corporation has taken to ensure that its business and its supply chain are free from slavery and human trafficking. The Statement is to be made publicly available on the corporation's website. It is unlikely that section 54 would be interpreted as imposing a positive obligation of due diligence. Corporations' are to account for their own satisfaction that they have prevented the occurrence of modern slavery in their supply chains. Further, the mandatory statement avoids being too prescriptive as it refers to a non-exhaustive list of matters for reporting and companies do not have to include all of them.³⁰³ The Home Office's Practical Guidance for compliance with reporting under the Act emphasises that the Statement should encapsulate the steps taken by the company to prevent slavery and human trafficking in its supply chain, and that it should be in plain English, succinct and readily accessible.

The EU Non-financial Disclosure Directive 2014 requires large companies meeting certain conditions to include in the management report a ***non-financial statement***, in order to understand its ***development, performance, position and impact of its activity, relating to environmental, social and employee matters, respect for human rights, anti-corruption and bribery matters***. The non-financial statement should include a list of procedural matters in order to shed light on the above, including the company's due diligence policies, non-financial key performance indicators, the company's risk management policies and assessment of non-financial performance above.³⁰⁴

This is transposed in the UK which now requires the directors' Strategic Report, i.e. the narrative report produced by the Board, to include the non-financial statement.³⁰⁵ The list above seems prescribed and could introduce an indirect form of procedural regulation.³⁰⁶ This could be a stronger form of supply chain governance, compelling changes in corporations' procedures and their relationships with suppliers, bringing the regulatory regime closer to the one under the Conflict

Minerals Regulation. However, we see no clear tendency towards treating the mandatory non-financial statement as a form of indirect procedural regulation. This is because the Commission Communication and the UK transposition frame the non-financial statement firmly within the familiar tenets of regulatory capitalism. The non-financial statement is addressed to investors, for them to exercise market discipline in non-financial issues.

Mandatory disclosure focuses on preliminary endeavours such as overcoming information asymmetry for the corporation concerned,³⁰⁷ and emphasises a predominantly internal and contractual form of management that is private to corporations and their suppliers.³⁰⁸ Although the Statement is of a primarily social orientation and not purposed as securities market disclosure, civil society scrutiny may be limited. The Statement is required to be concise, and the devolved implementation to corporations of their procedures may render such implementation essentially inscrutable by stakeholders. Devolved implementation obscures bimoral conflicts, opposing incentives and corporate culture, and could even legitimate a regressive form of behaviour, i.e. corporate-centred implementation to the exclusion of multi-stakeholder governance. A brief survey³⁰⁹ conducted of a small sample of Modern Slavery Statements in the first year of compliance shows that corporations disclose the existence of their internal codes of ethics and assert that they implement due diligence and other procedures. The corporations surveyed co-opt no multi-stakeholder guidance or partnership in fighting modern slavery. Civil society also has no standing for enforcement, as the Home Office is primarily responsible for enforcement. We are sceptical as to the potency of regulatory enforcement as the Home Office is tasked with more pressing enforcement responsibilities and we do not see the Home Office as an ongoing supervisor of companies' procedural systems and governance. Empirical research also finds that mandatory disclosure under the Modern Slavery Act has had little impact upon corporate procedures and behaviour.³¹⁰

Such regulatory endeavours pale somewhat against initiatives in the transnational governance sphere which have developed multi-stakeholder standards and methodology for due diligence, such as third-party auditing or certification. Some examples are SHIFT-Mazars assurance standard for human rights management,³¹¹ the SA8000 certification standard for fair treatment of workers in workplaces.³¹² Soft law seems to have achieved clearer and more precise articulation of standards in supply chain governance, such as the Clean Clothes Model Code of Conduct.³¹³ Regulation has avoided hardening substantive norms of social justice, and implements a regime to devolve to corporations the implementation of appropriate processes. This could even result in retardation in the development of social justice norms more generally in relation to labour practices and wage justice.³¹⁴

Indeed, the Home Office Practical Guidance for the Modern Slavery Act clearly states that mandatory disclosure is not tantamount to a warranty by the corporation that such crimes do not occur. This in effect sums up the limitations of the disclosure regulation- that in the absence of norms that deal with conduct or outcomes, disclosure and procedural regulation bear a weak connection to the issues of social justice sought to be addressed.³¹⁵

Although the EU Directive also facilitates devolved implementation, the European Commission is keen to ‘nudge’ companies³¹⁶ into adopting multi-stakeholder developed procedures for supply chain due diligence in three sectors: oil and gas, information technology and communications and recruitment agencies, a product of multi-stakeholder governance.³¹⁷ A empirical study of non-financial statements produced by UK listed companies finds generally good quality disclosure, with the exception of human rights reporting,³¹⁸ perhaps highlighting corporations’ continued struggles within their supply chain.

(c) Corporate Transparency in Social Responsibility Matters

Corporate transparency in CSR matters has always been regarded as a key means to advance corporate engagement with social responsibility. Such disclosure is essential for overcoming information asymmetries with stakeholders, civil society, and securities markets.³¹⁹ Voluntary CSR reporting has been on the rise as companies perceive reputational benefits in engaging with these matters. With the growth of the market for voluntary reporting, is there a need for mandatory disclosure? It could be argued that mandatory reporting is intended to signal the change in nature of non-financial reporting from being investor-centric³²⁰ to being substantively concerned with CSR as such.³²¹ On that basis, mandatory disclosure is necessary in order to overcome the self-selecting biases of companies in voluntary reporting. However, there seems no explicit elevation of stakeholders in terms of corporate accountability to them, nor is there articulation of particular social goals that corporate transparency is to facilitate. Without a clear alternative basis for such mandatory disclosure, it has to be placed within its default context, i.e. serving investor-centric purposes in securities markets.

³²⁰ The UK has since 2006 required the directors’ business review, a narrative report, to contain information on how environment and stakeholder issues relate to business performance, formerly s417, Companies Act. This is superseded by s414A, the Strategic Report, which continues to be investor-centric, Iris H-Y Chiu, ‘Reviving Shareholder Stewardship: Critically Examining the Impact of Corporate Transparency Reforms in the UK’ (2014) 38 Delaware Journal of Corporate Law 983.

³²¹ Preamble 3.

The UK transposition of the EU Directive subsumes the non-financial statement within the existing paradigms of corporate transparency/securities regulation. The statement is situated within the directors' Strategic Report, a narrative report centred upon explaining financial performance and business risks to investors. This is not inconsistent with the Directive's requirement that the statement be included in the management report,³²² highlighting the Directive's ambivalence regarding the orientation of the statement. The Financial Reporting Council in the UK has further clarified that the non-financial statement, like the Strategic Report, should be guided by the standard of materiality,³²³ which frames the nature of disclosure according to what may be material to a reasonable investor. Although this is not inconsistent with the Commission Communication for implementation,³²⁴ the Communication also explicitly states the stakeholder-orientation of the statement.³²⁵ In sum, the EU seems ambivalent with regard to the market or social orientation of the statement, but the UK's implementation more clearly frames the statement to be investor-centric.

Disclosure regulation is often described as 'sunlight', being the 'best disinfectant' for behaviour that may otherwise be hidden. However, it is also a regulatory tool of minimum intrusion as it merely compels information to be released so that the market can determine the necessary economic discipline.³²⁶ There is even some investor interest in the financial implications of a corporation's compliance with the Modern Slavery Act.³²⁷ In relation to socially responsible behaviour, the mandatory disclosure tool suffers from several limitations. One is that mandatory disclosure is addressed to securities markets, and reliance is placed on investors to effect discipline for change in corporate behaviour. Investors are highly diverse, and even if some groups may monitor such disclosure and assess their relevance to investment decisions,³²⁸ other groups may be indifferent.³²⁹ This results in mixed signals and may be overall ineffective in sending a market message to corporations. Second, it is not certain what 'market discipline' is intended to be motivated by mandatory disclosure. If we expect investors to exercise 'voice' in their corporate governance roles for CSR, many mainstream institutional investors play a very limited role.³³⁰ If 'market discipline' comes in the form of 'exit', this merely drives corporate behaviour to manage their 'social responsibility' profile for the business case.³³¹ Empirical research has found that social responsibility

reports focused on the business case tends towards being narrow and individualistic, so mandating social disclosure to investors may not be consonant with meeting social expectations.³³²

We should not assume that a financially-driven and marketised framework for discipline and enforcement would clearly reshape corporate incentives and behavioural tendencies towards socially optimal objectives. Incentive-based, instrumental behaviour can trump normative premises³³³ and the legalisation in the EU Directive could produce the counter-intuitive effect of undermining the social-ness of CSR norms that corporations should reckon with. However, the opposite can also occur, ie the infusion of the salience of CSR norms into investment marketplaces incrementally introduces re-orientation of market perceptions with social ones,³³⁴ producing a holistic integrative effect that can overcome the myopic and calculative culture of modern institutional investment. This requires more significant institutional change, which Strine³³⁵ for example doubts would happen.³³⁶ The UK transposition of the ambivalent premises in the EU Directive has avoided paradigm change, although some see the usefulness of generally overcoming information asymmetries for the purposes of informing civil society or stakeholder activism.³³⁷

(d) UK Reforms towards Stakeholder Inclusiveness in Corporate Governance

The complaint so far of a lack of paradigm change is based on observations of the corporate-centric and market-centric premises and implementation of recent corporate regulation reforms, signalling no significant shift from the tenets of regulatory capitalism. There is however an emerging corporate law reform in the UK that holds promise for more fundamental change, as formalised stakeholder engagement with corporations will be implemented. This can usher in an era of multi-stakeholderism in corporations, shifting away from investor centrality, and generally mitigating the weaknesses in regulatory reforms discussed above.

The Department of Business, Energy and Industrial Strategy has embarked on legislative and soft law reforms that purport to recalibrate in stakeholders' favour, their relations with corporations.³³⁸ It may be criticised that most reforms are in soft law³³⁹ and the legislative initiatives only enhance shareholders' roles. The cynical view is that the reforms resist institutional change by giving stakeholders illusory and non-consequential 'improvements'. In the alternative we may view the confused premises of these reforms as representing a genuine struggle towards institutional change.

³³⁹ Discussed below.

First, employees are the only group of stakeholders given more voice in strategic decision-making at companies. This is to be achieved in one of three ways: nominating a non-executive director dedicated to employee issues, nominating an employee-director or setting up an employee advisory council to advise the Board.³⁴⁰ These changes are proposed to be made to the Corporate Governance Code. Code standards are nevertheless subject to 'comply-or-explain' by listed companies, and the Code is founded on shareholder primacy.³⁴¹ Shareholders could in theory agree to companies deviating from these measures if they accept companies' explanations.³⁴²

Next, directors are to report explicitly on how they have engaged with stakeholder-focused considerations in the Strategic Report.³⁴³ Such disclosure is however pursuant to the directors' duty in s172 of the Companies Act, which hold directors to account to shareholders for how they 'promote the long-term success of the company'. It remains uncertain how the continued maintenance of the shareholder primacy focus in such stakeholder-related reporting would advance stakeholder inclusiveness in corporate considerations.³⁴⁴ Best practices for stakeholder engagement would be developed in the form of soft law led by professional and industry associations.³⁴⁵ One of the associations involved in this initiative is the Investment Association representing investors. Can such leadership advance stakeholder engagement with companies on stakeholders' terms?

Finally, the BEIS will introduce legislative reform to compel companies to disclose the pay ratios of their UK employees. This seems to meet the social demand for scrutinising inequalities in reward that have developed in the corporate sector. However, such disclosure is primarily targeted at shareholders who scrutinise this as part of their role in approving directors' remuneration packages.³⁴⁶ Stakeholders seem disengaged from this issue,³⁴⁷ which ought to be of social orientation and importance.

Soft law has been employed for stakeholders to be 'relationised' within corporate governance, while company law continues to feature the dominance of shareholders. However, the institutional stature of soft law cannot be totally underestimated. Stakeholder engagement is now a 'best practice' implicitly supporting polycentric principles of governance. Even if the confused and contesting premises between shareholder-centric and stakeholder theories of the corporation are not reconciled overtly,³⁴⁸ space is formally opened up for stakeholders to exert pressure to 're-socialise' the corporation, and the state has finally taken on a coordinating role to facilitate this. Nevertheless, the implementation of stakeholder engagement reforms runs the risk of being merely proceduralised. Stakeholder engagement can be carried out in superficial manner and do not

fundamentally affect business strategy or corporate culture.³⁴⁹ It remains uncertain if the domination of investor-centric input into the development of stakeholder engagement can crucially weaken such development; and whether implementation would be devolved largely to the corporation.

The Table below sums up the achievements in each regulatory reform that indicates an institutional shift, mapped against limitations showing adherence to the tenets of regulatory capitalism.

	Indicators of Institutional Change	Indicators of Institutional Adherence
Conflict Minerals Regulation	<ol style="list-style-type: none"> 1. Direct procedural regulation 2. compulsory third party monitoring and potential for formally recognised multi-stakeholder governance 	<ol style="list-style-type: none"> 1. no overt articulation of social objectives (A)

³⁴⁹ Jean-Pascal Gond, 'Reconsidering the Critical Corporate Social Responsibility Perspective through French Pragmatic Sociology: Subverting Corporate Do-Gooding for the Common Good?' in Baars (ed), *The Corporation* (2017), ch 23.

Next, we account for why regulatory reforms in legalising aspects of CSR are underwhelming and the implications of addressing the precise locations of weakness.

D. Why Legalisation of CSR is Underwhelming and Concluding Thoughts

Calleiss and Renner argue that³⁵⁰ soft law hardens when its function arrives at a state of 'stabilisation of normative expectations'. We may expect the legalisation of aspects of CSR reflects 'mature' moments of recognition for certain aspects of CSR, *viz* as public goods, as stabilising certain socially-facing norms of conduct for corporations, and for corporate accountability to be provided in innovative ways including the engagement of multi-stakeholder governance.³⁵¹ Although the flexibility of soft law is often positively regarded, Short argues that 'falling back' on self or soft regulation is often a manifestation of a regulatory 'void'- the lack of resolve to address problems.³⁵² Commentators support the formalisation of public policy in CSR, such as into regulation, as one or more of the following benefits can be attained:

(a) leadership in setting public interest objectives;³⁵³

(b) the orchestration of governance capacity on the part of public and private actors by assigning regulatory responsibilities, and coordinating a systematic and coherent framework, supported by regulatory intervention to moderate imbalances in power and influence;³⁵⁴

(c) support for the implementation of changes by private actors, whether by corporations or by other third parties in frameworks of governance, such as co-regulation,³⁵⁵ and

(d) the provision or coordination of enforcement capacity in different and multi-faceted ways in order to secure corporate compliance and behavioural change.³⁵⁶

However, if we measure the achievements of the corporate regulation reforms discussed in Section C against the expectations stipulated above, the achievements seem underwhelming.

First, the Table in Section C shows that the articulation of substantive obligations is limited, and has only been more clearly achieved in anti-bribery and anti-tax evasion. In the absence of clearer and stronger normative premises, task-based and procedural requirements may produce compliance of an underwhelming quality, as corporations can revert to their own centrality and market-facing priorities in order to determine their implementation. It remains questionable if there is clear engagement with ethics, social expectations and corporate culture.

The lack of genuine social advancement in some CSR areas may be attributed to the still-contested nature of these issues in the polycentric transnational sphere.³⁵⁷ The ‘hardening’ or ‘legalisation’ of substantive norms is limited in two ways. One is that substantive norms that are legalised reflect already-achieved consensus in inter-governmental organisations, advancing nothing much that is novel. The due diligence obligations in conflict minerals, anti-bribery and the fight against tax evasion using offshore havens, have been developed extensively over the decades under the OECD.³⁵⁸ In particular, norm advancement in anti-bribery and tax evasion were achieved due to economic interests at play. US business economic interests were key to the US government adopting the Foreign Corrupt Practices Act 1977 and its sustained championing for international convergence which was finally achieved in the late 1990s at the OECD.³⁵⁹ Further, anti-tax evasion norms have arguably been advanced in the UK after the global financial crisis due largely to the government’s interests in shoring up its fiscal weaknesses.³⁶⁰ The alignment of economic interests and political strength are key to policy choice and norm changes. Such are still relatively lacking in relation to supply chain responsibility, as the implications for multinational corporations would be an undesirable culmination in enterprise liability and an expansion of their legal risks.³⁶¹ Hence, in relation to corporations’ *responsibility* to prevent human rights violations or manage supply chain misconduct, norms are much more contested in terms of the scope of corporate responsibility in a network of commercial relations.

We also see the lack of advancement in regulatory commitment to norms of social justice as being due to the lack of multi-stakeholder governance or a Habermasian³⁶² discourse in the polycentric space regarding the future of our capitalism model and institutions. Although we see ‘new governance’ techniques employed to an unprecedented extent to reach into the organisation and procedures of corporations, much of regulatory implementation results in devolution to the

³⁶¹ MNCs are able to structure risky activities in subsidiaries in order to protect parent companies from liability. In the UK this is helped by the persistent refusal of UK courts to allow enterprise liability by applying the ‘lifting of the corporate veil’, *Adams v Cape Industries plc* [1990] Ch 433; *Prest v Petrodel Resources Ltd* [2013] UKSC 34.

³⁶² Jürgen Habermas, *Between Facts and Norms: Contributions to a Discourse Theory of Law and Democracy* (Cambridge, Mass: MIT Press, 1996); *Communication and the Evolution of Society* (Beacon Press, 1979), *Moral Consciousness And Communicative Action* (MIT Press, 1990), *The Theory of Communicative Action, Vol. 2: Lifeworld and System: A Critique of Functionalist Reason* (Boston: Beacon Press, 1985).

corporation or scrutiny by securities markets. Corporations manage their supply chain governance as an extension to their contractual governance, and it is queried if the continued dominance of the commercial context would bring any fundamental change to corporations' incentive-based behaviour. There is still too much deference to the corporation and its self-regulating capacity, and misplaced reliance on capital markets to develop an aligned 'market for virtue'. The continued failure of regulatory incorporation of the 'new governance' ethos of polycentricity could be a key impediment to institutional shift. Except for the mandatory requirement of third-party auditing under the Conflict Minerals Regulation, there is reference to multi-stakeholder governance in other regulatory reforms discussed.

Legalisation has avoided hardening or recognising existing civil society initiatives in CSR. The lack of recognition for the achievements in transnational governance,³⁶³ or advancement in promoting the ethos of multi-stakeholder governance can be attributed to the incompatibility of such governance with the capitalist institution of the UK's liberal market economy. This capitalist model eschews the notion of regulators taking a lead in coordinating polycentric governance. Orchestrating such coordination may be seen to be intervening with the freedoms of constituents who should be allowed to express their discipline in the open 'market for virtue'. However, the 'market' commercialises 'virtue', and may not price virtue in alignment with its social and public interest aspects. Moreover, the 'market for virtue' is not a level playing field. Voices derived from capital (investors) are accorded with more legitimacy, and civil society voices can be marginalised, enjoying no real freedom of exercising discipline. It may be necessary for states and regulators to coordinate stakeholder and civil society involvement more explicitly³⁶⁴ in order to (a) signal the public interest orientation of CSR issues (and not merely their commercial or market relevance) and (b) compensate for stakeholders' and civil society's relatively disadvantaged positions in exercising governance. Pluralistic and inclusive frameworks can be key to fostering discourses that may give rise to substantive changes in values, norms or goals.³⁶⁵

In the UK, stakeholder-focused reforms in soft law that are afoot in corporate governance hold some promise for introducing a formal multi-stakeholder governance space surrounding corporations. This reform may be important for future advancement of CSR causes. Employees are to be formally organised in order to input voice into corporate governance, and research has shown that they are keen to advance labour justice and human rights issues.³⁶⁶ Other stakeholder engagement mechanisms to be developed in soft law can also form the basis for developing multi-stakeholder governance over CSR issues. However, there are a few caveats in viewing such stakeholder reforms as being equivalent to the coordination of polycentric/multi-stakeholder governance in CSR issues. Stakeholder engagement mechanisms are likely focused on each group's *interests* and may not be focused on particular CSR issues. Such engagement mechanisms may be seen as private dialogues and communications, and may not revolve around public interest or the provision of public goods. In the absence of the 'public' coordinating hand, the dynamics and coordination within such mechanisms would become private interactions, and 'governance' potential or capacity may not be galvanised.

It may be argued that civil society groups should also improve their transparency, social accountability, representativeness and legitimacy in order to become truly credible actors in the

multi-stakeholder governance space. These issues are acknowledged,³⁶⁷ but the imperfections of such groups can be worked upon. Civil society groups may be comparably lacking in capacity, resources and sophistication *vis a vis* corporations and their industry associations.³⁶⁸ Indeed states and regulators should engage with them more and look into capacity-building. Such imperfections cannot amount to good reason for their marginalisation.

Corporate regulation reforms in legalising aspects of CSR seemed to hold promise in changing the nature of corporate regulation. We acknowledge the incremental achievements but remain underwhelmed. We account for the limitations in recent regulatory reforms by highlighting their institutional adherence. The institutional account of recent corporate regulation reforms within the paradigm of regulatory capitalism explains the limited achievements in the implementation of 'new governance' and the purported legalisation of CSR. This institutional account nevertheless pinpoints precise locations of impediments to institutional change, so as to inspire resolve to face the heavier lifting ahead.

about ECGI

The European Corporate Governance Institute has been established to improve *corporate governance through fostering independent scientific research and related activities*.

The ECGI will produce and disseminate high quality research while remaining close to the concerns and interests of corporate, financial and public policy makers. It will draw on the expertise of scholars from numerous countries and bring together a critical mass of expertise and interest to bear on this important subject.

The views expressed in this working paper are those of the authors, not those of the ECGI or its members.

ECGI Working Paper Series in Law

Editorial Board

Editor

Luca Enriques, Allen & Overy Professor of Corporate Law,
Faculty of Law, University of Oxford

Consulting Editors

John Coates, John F. Cogan, Jr. Professor of Law and
Economics, Harvard Law School

Paul Davies, Senior Research Fellow, Centre for Commercial
Law, Harris Manchester College, University of Oxford
