6 Between Past and Present : the Sociopsychological 7 Constructs of Colonialism, Coloniality and Postcolonialism–

8 Ana Tomicic & Filomena Berardi, Sapienza University of Rome

9 Commentary: Giovanna Leone, Sapienza University of Rome

10 11 12 **Abstract**

13
14 If one of the major aspirations of postcolonial theory is to re-establish a balance in the
15 relationship between the (former) colonizer and the colonized by engaging the voices of
16 the “subaltern”, and on the other hand to illuminate how power relations of the present
17 are embedded in history (Mills, 1997), we argue that important theoretical insights might
18 framework. While there is a growing corpus of sociopsychological research articles
19 focusing on how major geopolitical events and historical processes bear on people’s lives,
20 we aim to investigate the theoretical potential of postcolonial theory within the
21 disciplines aiming at a sociopsychological approach.

22 By focusing on the social dynamics of power imbalances, post-colonial theory finds its
23 operational meaning: the feelings stemming from actions committed in the past are
24 indeed crucial in determining reparatory attitudes and policies towards members of
25 former colonized groups. Firstly, drawing from the sociopsychological scientific
26 production related to consequences of colonial past, seen in recent years as a growing
27 research interest in the field, we will explore patterns and trends through a thematic
28 analysis of literature. Social Psychology as well as adjacent disciplines can greatly
29 benefit from this theoretical fertilization, especially in the way post-colonial
30 ideologies relate to the symbolic promotion versus exclusion of indigenous culture
31 (Sengupta, N., K., Barlow, F., K., Sibley, C., G. 2012). Furthermore, by comparing
32 and contrasting the ideological cosmologies relating to this particular topic, this study
33 aims to establish the state of knowledge in the field, to identify how research methods
34 and thematic fields are paired, to find “gaps” and create spaces for research that become
35 integrative of postcolonial theory. While focusing on academic production, we also
36 hope to contribute to develop the idea of cosmopolitanism within academia but also
37 beyond academic doors.

Introduction

Colonialism, as a political doctrine that advocates or seeks to justify the exploitation of a colony, territory or country by a foreign state, relates to the past expansion of the colonizing countries, which takes place in less developed, or militarily weaker territories. The term coloniality, on the other hand is used to “address 'colonial situations' in the present period in which colonial administrations have almost been eradicated from the capitalist world-system” (Grosfoguel, 2005).

While Neocolonialism refers, from the 1960s onwards, to the various attempts of an ex-colonial power to maintain, by hidden or indirect means, the economic or cultural domination over its former colonies after their independence, Postcolonialism is first of all a critique of Western Europeanism, which tends to reduce the status of an object of analysis to its monopoly on theoretical and academic fields. Although presently very popular in socio-cultural and literary studies, and although many foundational constructs of cross-cultural psychology such as acculturation, stereotypes, ethnic identity, and collective self-esteem are common grounds both in postcolonial theory and in psychosocial analyses of the social context, many authors suggest the postcolonial perspective is a relatively marginal theoretical resource within the fields of Social Psychology and its adjacent disciplines. As Okazaki notes, “discussions about how larger sociopolitical conditions, especially oppressive or colonial ones, may play a role in shaping such cultural constructs have been scarce.” (Okazaki et al., 2008). Considering the awareness in sociopsychological theory of how the social and cultural contexts shape both individual and group identity, this lack of insight comes as a surprise. Or spelled out in a harsher, critical stance as Steven Frosh did, “a psychological engagement with postcolonialism, is relatively rare, given the stance of apolitical naivety that academic psychology commonly adopts” (Frosh, 2013).

If it is postulated that one of the major aspirations of postcolonial theory is to re-establish a balance in the relationship between the (former) colonizer and the colonized by engaging the voices of the “subaltern”, and on the other hand to illuminate how power relations of the present are embedded in history (Mills, 1997), we argue that important theoretical insights might inform psychological research by anchoring post-colonial theory within a social psychological framework.

The challenge here has to do from one side with the ongoing mindset that leads dominated people to accept the stereotypes of the dominants’ discourse, and the dominant ones to compromise themselves by perpetuating them (Licata, 2012). This mindset supposedly permeates academic practices as well: relevant psychological theories, when not provided with sufficient international power and prestige are perceived as being too difficult (Liu, 2012), so scholars of colonized countries might not connect their everyday lives with their professional lives in the way they approach relevant societal phenomena, as they are still entangled in a regime of (academic) international consumption.

Clearly, seeing the world differently and from a multiplicity of marginalized perspectives is fine, but then what? How can a postcolonial approach inform the discipline of Social Psychology and to which aims? And if there is a fruitful potential of cross-fertilization, why is it still in a dormant state? Is Social Psychology only “too western” or still colonial?

2 101 **A brief overview of postcolonial thought**

4 103 According to Edward Saïd, a founder in the academic field of postcolonial studies,
 5 104 postcolonial theory is one of the crucial intellectual legacies of Gramsci's analysis of
 6 105 hegemony as (cultural) domination without visible coercion, and Foucault's analysis of
 7 106 the historical connivances between knowledge production and power interests.
 8 107 Nowadays, "if the divergent body of work known as "postcolonial literature" shares a
 9 108 common project or goal, it would be a broad critique of Western metropolitan culture:
 10 109 its histories of domination and hegemony over its others, its assumption of civilizational
 11 110 superiority, and most importantly the discourses that have informed those histories and
 12 111 assumptions."(Lopez, Marzek, 2008). Or as sociologist Vivek Chibber explains, "[O]ne
 13 112 of the key elements of postcolonial theory is that it critically discloses the cultural logics
 14 113 attendant with empire. In fact, it examines all types of discourses, epistemes, cultural
 15 114 schemas, representations, and ideologies that were part and parcel of Western
 16 115 imperialism" (Quoted from Parker, 2015). Since postcolonialism is less a unified theory
 17 116 than a more global perspective of an eclectic set of authors from diverse theoretical
 18 117 affiliations, it is difficult to identify parsimoniously what would constitute its core. Some
 19 118 key concepts and major orientations are nevertheless to be emphasized. These include
 20 119 criticism of Eurocentrism, interest in formerly colonized regions or the developing
 21 120 world, the analytical priority given to subordinate or invisible actors, the importance of
 22 121 the figure of the migrant, and the centrality of cultural and ethnic identity considered as
 23 122 mobile and "Métis" rather than stable or pure. Indeed, a major ontological orientation of
 24 123 postcolonialism concerns the question of cultural identity.
 25 124

26 125 The colonial perspective is extremely diverse in terms of both the themes and how they
 27 126 are addressed. Authors of this movement can perhaps be seen both as critical towards
 28 127 the dominant theoretical production in the social sciences, as well as skeptical with
 29 128 regards to the face of any methodological or epistemological rigor. Indeed, from a
 30 129 normative point of view, they are characterized by a notable humanistic bias, leading to
 31 130 three main characteristics emerging from postcolonialist writings: strategic relativism,
 32 131 critical historicism, and methodological pluralism. Strategic relativism is a perspective
 33 132 that is primarily opposed to the idea that all knowledge can be universally, geographically
 34 133 and culturally valuable. Postcolonialism thus proposes to review the world from
 35 134 perspectives that are conscious of their historicity as well as their situationality. That is
 36 135 what Sandra Harding (1998) calls a "strong objectivity" - the idea that there is nothing
 37 136 relativistic about accounting for the plurality of points of view on the social world. On
 38 137 the contrary, since it is a question of producing narratives as diverse as possible in order
 39 138 to better grasp the world as a whole. Not because they are intrinsically superior to
 40 139 Western knowledge, or even essentially different, but because they offer additional
 41 140 narratives to be grasped (Pouchepadass, 2007). One seeks to consider the social world
 42 141 from as many angles as possible to provide more comprehensive analyses. In a
 43 142 postpositivistic orientation, postcolonialist authors also share a highly critical view of
 44 143 history, which is considered one narrative among others, and a narrative tendentially
 45 144 partial since often narrated from the perspective of the elites.
 46 145

47 146 Yet, postcolonialists do not succeed in solving the problems they have raised because
 48 147 they have not clarified the theoretical questions of the relations of extraversion and
 49 148 coercion to hegemony and the reproduction of it. Fostering postcolonial theory with the
 50 149 theoretical and methodological tools of those subdisciplines of psychology that look into

150 the sociopsychological elements of the power dynamics which constitute the
151 (post)colonial relationships might offer a generative inquiry and a roadmap to better
152 knowledge production and praxis. As Derek Hook emphasized, “What the writings of
153 Fanon and Biko make plain in this connection is the degree to which the narratives and
154 concepts of the social psychological may be reformulated so as to fashion a novel
155 discourse of resistance, one that opens up new avenues for critique for critical
156 psychology, on one hand, and that affords an innovative set of opportunities for the
157 psychological investigation of the vicissitudes of the postcolonial, on the other.” (Hook,
158 2005)

159
160 From the field of critical psychology, Okazaki maintains “there is enormous social,
161 psychological, and infrastructural work in producing the colonized person. Thus, a
162 postcolonial consideration of contemporary individuals needs to consider the effects of
163 that psychological and institutional infrastructure into the present day. Here, we can
164 think of the often wholesale degradation of the ‘native’ culture or practices, or again, of
165 what it means that concepts of the ‘modern’ often entail the dismissal of local practices
166 and ideas. In this way, it is critical for psychology to be attentive to colonial discourses
167 and their legacies in order to appreciate the effects of the discursive regimes that made
168 postcolonial subjects.” (Okazaki, 2008)

169
170 Why should such proposals be formalized? Or “What might be the most crucial
171 contributions that postcolonial critique can make to the project of critical and social
172 psychology?” (Hook, 2005). First, to contribute to making Social Psychology a discipline
173 in truly international and engaged practice, moving away from the academy to the sphere
174 of politics, social change and human well-being, because as Hayes (2001) claims, “critical
175 psychology would be incomplete if it did not try to take on the injustices and inequalities
176 of the world“. And secondly, because an overview of the world seems more than
177 necessary in these globalized times - as a means of consolidating resistances to power, we
178 should keep in mind “the retrieval of a ‘psychopolitics’ in which we not only place the
179 psychological within the register of the political, but - perhaps more challengingly - in
180 which the political is also strategically approached through the register of the
181 psychological” (Quoted from Parker, 2015).

182 183 184 **Social psychology and postcolonialism – divergences and common grounds**

185
186 In this context, it is worthy reminding that psychology’s rise as a modern social science
187 coincided with colonial regimes, and that a wide array of methods were developed
188 informed by scientific racism, including psychological testing, craniometry, etc (Gould,
189 1996). Moreover, in the last decades, many authors have analyzed the role that disciplines
190 such as history and English literature¹, anthropology², and science in general³ have played
191 in promoting and implementing the Orientalist vision formulated by the European
192 colonial powers. Bhatia remarked that “Orientalist ideas about non-Westerners have
193 consistently echoed in the writings of the pioneers of developmental psychology such as
194 Darwin, Galton, Hall, and Spencer.” (Bhatia, 2002). Desmond Painter, discussing
195 postcolonialism within critical psychology, and referring to Bhatia and Richards, says that
196 “critical historiography in psychology reveals the epistemological assumptions and

57
58 ¹ (Bhabha, 1994; Saïd, 1979; Spivak, 1993)

59 ² (Asad, 1973; Clifford & Marcus, 1986)

60 ³ (Adas, 1989; Alvares, 1980; Prakash, 1999)

197 representational practices by which the discipline had historically become entangled with
198 – informed by but also informing – Western colonialism and racism (Painter, 2015).”
199 Although he later acknowledges “psychologists strongly believe that their
200 “psychological” assumptions about the “Other” were derived from objective scientific
201 and logical reasoning” (ibidem). Additionally, Semali & Kichenlo (2002) argued that “all
202 Indigenous knowledge is subjugated by Western science and its episteme”, and the
203 practices leading to it constitute a form of scientific imperialism, or ‘colonization of the
204 mind’. (Dascal, 2009). Okazaki as well admits to the disciplinary limits of psychology
205 which “must necessarily ask which questions about the human experience can best be
206 understood using its epistemology” and then asks “what might a more historically
207 situated (cross-)cultural psychology look like?” (Okazaki, 2008). As a sort of unintended
208 reply, Derek Hook suggests the postcolonial perspective could equip “researchers and
209 activists alike” to “more thoughtfully unpack and react to the underpinnings of
210 postcolonial racism” with “new possibilities for analyses of racism undertaken by social
211 psychologists (...) Understanding the mechanisms that contribute to racism through this
212 lens can be incredibly useful in developing a realistic perspective of the pervasiveness of
213 racism in their communities” (Hook, 2012).

214
215 Considering the many unaddressed common grounds between postcolonial theory and
216 psychology - acculturation, stereotypes, ethnic identity, collective self-esteem, knowledge
217 production etc. - and such contrast between social psychology and the social sciences
218 more generally, has led some authors to emphasize the intellectual isolation of the
219 discipline and its resistance to taking into account the important debates taking place in
220 other disciplines. As Okazaki, David and Abelman remarked, “Psychology’s longstanding
221 concern with the social dynamics of power imbalances have much to contribute to the
222 discussion on the legacies of colonialism on one’s identity and subjectivity.” (Okazaki,
223 David, & Abelmann, 2008). Notwithstanding its valuable insight on “hot” psychosocial
224 topics, such as the new "Orientalization" of the Islamic world, the Palestinians facing
225 “colonialism”, but also the Turkish Gastarbeiter in Germany, only to list a few examples,
226 in psychology “colonialism has primarily been engaged in two ways: the study of the
227 colonial impact on individuals; and the consideration of the colonial impact on the
228 discipline and practice of psychology in formerly colonized nation states.” (Okazaki,
229 David, & Abelmann, 2008). Although the “coloniality” of Israel is being debated and
230 Turkey was never colonized, they can be thought of as being in a “postcolonial”
231 situation: whether thought of as cultural theory, as a political or historical condition, as a
232 critical approach or a form of art and writing, postcolonialism is far from being a
233 homogeneous discourse (Barelli, 2001; Goldstein et al., 2002; Cohen, 2011). As
234 Georges Balandier, defines it as a “Situation which is actually shared by all our
235 contemporaries” — a definition that tends to identify it with globalization: “We are all, in
236 different ways, in a postcolonial situation.” (Quoted from Bayart, 2011).

237
238 In terms of existing sociopsychological studies on the topic of colonialism devoid of the
239 postcolonial perspective, many researchers do contribute to address the collective
240 memories of colonial times through a wide range of themes and issues ranging from
241 group and intergroup relations with regards to consequences of past and present
242 misdeeds (Leone, 2010; Klein, 2011; Figureido, 2015; Nurit, 2015; Liu, 2015), the state of
243 indigenous psychology (Gabrenya Jr., 2006), experiences of racism (Wood, 1994; Finlay,
244 2000; Swim, 2003; Vala, 2008; Sidanius, 2010), the effects of colonial on identity
245 development (Rata, 2014; Bonnot, 2016), etc. In the vast majority of scientific
246 production within that area, social identity theory is widely used as an explanatory tool,
247 exploring the predictive power of sociopsychological factors. But the postcolonial

248 approach has an epistemological aim, which exposes both the violence inherent in a
249 particular idea of reason and the gulf, which in colonial conditions separates European
250 ethical thought from its practical, political and symbolic decisions. It thus intends to
251 inspire the social sciences towards a deconstruction of their categories. But on the other
252 hand, as Achille Mbembe, Cameroonian philosopher and political theorist, clarified,
253 “Postcolonial thought is not an anti-European thought. On the contrary, it’s the product
254 of the encounter between Europe and the worlds it once made into its distant
255 possessions.” (Mbembe et al., 2006). Thus, it refers less to the empirical conclusion that
256 colonial empires belong to the past than to a project of overcoming by criticism what
257 survives today of this past in the discourses that express them. According to Béatrice
258 Collignon (2007), postcolonial studies “invite researchers to take an interest in how
259 multiple individual identities and community groups are made and disentangled
260 according to the logics of the moment, because identities are fundamentally hybrid, and
261 therefore always in motion.” Contrary to what some of its detractors believe,
262 postcolonialism does not seek to celebrate the return to pre-colonial cultural identities,
263 nor to magnify non- authenticity or their absolute difference - postcolonialists are rather
264 marked by a common sensitivity towards the problematization of cultural identities,
265 which are seen as essentially multiple and constantly changing, and not fixed by which
266 national boundaries. In this movement, the concept of hybridity is central: a sort of
267 “third space” that escapes cultural binarisms, the hybrid cultural formation being neither
268 the one nor the other, but beyond the polarities, basically relational (Bhabha, 2009).
269 Cultures are seen as plural, mobile and changing, widely used in postcolonial literature to
270 re-read colonial history from a perspective of the cultural relationship between the
271 colonizer and the colonized, including mimicry, parody and ambivalence, rather than
272 pure domination.

273
274 Finally, while it is clear that postcolonialists prefer mainly qualitative methods to better
275 grasp the social world from the perspective of the actors studied, they are deployed in
276 the field of both empirical and non-empirical research, while socio-psychological contrcuts
277 seem to be often entangled in a mainstream positivistic quantitative approach. The
278 predominant influence of literary studies and of history in the emergence of
279 postcolonialism as a theoretical current often leads authors to favor methods of
280 analyzing written texts such as archives, newspapers, reports, letters, novels, poetry,
281 brochures, popular songs or visual documents. Research is therefore oriented towards a
282 kind of archeology (or genealogy) of the present. Deeply humanistic, the postcolonialists
283 largely share a normative bias on the need not to describe, explain or predict the world as
284 it is as the dominant theories in the social sciences have put it, but to understand and act
285 on a world in flux, in emancipatory lines. This approach is mainly based on the idea that
286 knowledge is never more than partial, fragmentary and incomplete: one can only
287 imperfectly know the social world, especially through the crossing of many culturally and
288 historically situated narratives, to restore its totality.
289 The decisive influence of post-structuralism is also reflected in a notable methodological
290 preference for discourse analysis and genealogical approach to the history of the present.
291 However, with the new interest in postcolonialism in the social sciences in general, work
292 of a more empirical nature based on fieldwork, ethnography, narrative and interviewing
293 is becoming more important.

294
295 Aiming to further investigate the potential of a theoretical cross-fertilization of
296 postcolonial theory, social psychology and its adjacent disciplines through a thematic
297 analysis of literature, and in order to identify patterns and trends, we have proceeded to

298 the analysis of a selected corpus of socio-psychological scientific production related to
299 coloniality.

300 **Methodology**

301

302 In our original research design, we devised a literature review within the discipline of
303 Social Psychology exclusively, but as disciplinary boundaries tend to muddle when
304 tackling particular topics by borrowing theories, constructs and concepts from each
305 other, we decided to expand our corpus to psychological sub-disciplines close to social
306 psychology in their conceptualization of certain social issues. Indeed, “more recent
307 discussions focus on the fact that the nature of the disciplines themselves is ambiguous
308 or evolving, (...) and researchers are incessantly borrowing from adjacent disciplines,
309 causing a ‘blurring of disciplinary boundaries’” (Newell, 2001; Klein, 1993). These
310 “permeation of boundaries” lead in some cases to a redefinition of the discipline.
311 Therefore, as our focus deals mainly with intergroup relations between the former
312 colonizer and colonized groups’ members, and the way they are addressed through
313 sociopsychological constructs from adjacent subfields of psychology, we were interested
314 in articles from the field of social, critical, indigenous, cross-cultural psychology,
315 ecopsychology, etc. Our criteria for inclusion were on the one side that the publications
316 make mention of colonialism or post(-)colonialism intended both as a historical, political
317 or psychological phenomenon *and* as a theoretical approach, and on the other side
318 address relevant sociopsychological constructs such as racism, discrimination,
319 stereotypes, conflict, guilt, etc. Our corpus harvesting process started with a general
320 keyword search in Web of Science (previously known as Web of knowledge) and
321 PsycInfo electronic database.⁴

322

323 We searched all the publications using the following command for “Title” and “Topic”:

324

325 TITLE: colonial* OR colonialism* OR postcolonialism* OR post-colonialism* OR post
326 colonial* OR post-colonial* OR postcolonial* OR intergroup relations*
327 TOPIC: social psychology* OR critical psychology* OR cross-cultural psychology* or
328 ecopsychology* OR intergroup relations*

329

330 After article filtering, a number of elements were removed from the original outcome, as
331 they did not contribute to the substantive material. Limiting our search to indexed
332 articles only, and ones written in English for compatibility purposes, the results of our
333 search were rather scarce. In order to expand our corpus, we then proceeded to a snow-
334 ball (Greenhalgh and Peacock, 2005) search of articles referenced within those resulting
335 from our Web Of Science and PsychNet search, obtaining a final corpus of 109 articles.
336 The list of included papers is listed in an online appendix available at
337 <https://sites.google.com/uniroma1.it/tomicic-berardi-appendix/home>

338

339 In order to explore our corpus we used a computer-assisted text analysis technique,
340 IRaMuTeQ, which presents the researcher with a simplified pattern of the words making
341 up the text for interpretation. This simplified pattern of the text, includes lists of the
342 most significant words grouped into “clusters” according to their relationship with one
343 another (i.e. words that most often appear in a sentence together), details of the

⁴ As of September 3, 2014[update], the multidisciplinary coverage of the Web of Science encompasses over 50,000 scholarly books, 12,000 journals and 160,000 conference proceedings. PsychInfo includes more than 2,450 journals in 29 languages, from more than 49 countries since 1806, representing the reference research database for psychological related disciplines all over the world.

344 relationship between the words and clusters and between the clusters (as chi-squared
345 measures) and significant sentences from the original text (Smallman, 2014).
346 The software IRaMuTeQ⁵ and is analogous to the more established commercial
347 ALCESTE software and has been shown to produce comparable results to those of
348 ALCESTE (Ratinaud and Dejean, 2009; Sarrica, Mingo, Mazzarra, Leone, 2016).
349 IRaMuTeQ does, however, have some advantages over ALCESTE: it is open source and
350 written in the computer language R, so it can be customized to perform particular
351 analyses; as it uses less computing power it represents a good option for researchers
352 interested in conducting textual analysis on larger textual corpora (Lahlou, 2012); it also
353 offers additional functionality, particularly in producing graphical representations of the
354 findings.
355 IRaMuTeQ provides five types of analysis: clusteric text statistics; specificities of
356 research groups; descending hierarchical clusterification; similitude analysis and word
357 cloud⁶. For our scope, we employed a clustering algorithm, aimed at detecting patterns in
358 the data that represent homogenous sub-groups. Our assumption is that these groups
359 articulate themes and methodological approaches differently, and hence represent
360 different trends within our selected Corpus. We therefore present the most plausible
361 interpretive labels for each contextualized cluster and interpret it by means of thematic
362 analysis, enabling us to ‘identify and examine themes from textual data in a way that is
363 transparent and credible’ (Greg, MacQueen and Namey, 2012). Further details of the
364 steps and statistical analyses involved are given in Kronberger and Wagner (2000),
365 Mutombo (2013) and Stoneman et al. (2013). The most significant words, their level of
366 association with each cluster and the graphs of the clusterifications were uploaded in an
367 online appendix.
368 Additionally, for each selected publications, we retrieved meta-data inserted in a Grid of
369 Analysis inspired by the Meta-theoretical Analysis Grid conceived by de Rosa (de
370 Rosa1994). We considered the following variables: First Author, Country of Birth of the
371 First Author (found through an online search), Location of Author’s Institutional
372 Affiliation, Journal of Publication, whether the article is Empirical or Theoretical, and
373 whether Postcolonial Theory was explicitly used or not. It is worthy noting that Atsumi
374 (2007) explained mainstream social psychology corresponds to the corpus of scientific
375 literature on social psychology created in the geo-cultural area of the USA. Atsumi (2007)
376 describes it as nomothetic, as it aims to find universally applicable theories while
377 disregarding the influences exercised by cultural and historical contexts.

378
379

380 **Characteristic of the corpus**

381
382
383
384

The corpus comprised 109 abstracts and their respective keywords (dated from 1979 to 2016), Intial Context Units (ICUs), which were first analysed lexicometrically with IRaMuTeQ (R Interface for Multidimensional Text Analyses)software 0.7 alpha 2.

⁵ Developed by Pierre Ratinaud

⁶ None of these produce clear ‘results’, but instead the researcher interprets all the specific outcomes, along with the original text, in order to build understanding of the discourses at stake. The most plausible inferences from the data are upon the researcher’s responsibility, which is of fundamental importance in the design of the study, organization of collected material, and the analysis process, as the software simply aids in the organization (Chaves, Dos Santos, Dos Santosa, Muller Larroca, 2017). In fact, the software accomplishes this using only a statistical approach to analyze the distribution of words in the corpus, while remaining completely deaf to the meaning of words themselves.

385 Initially the corpus was found to be fit for the analysis (49,83% HAPAX 50%;
386 type/token ratio 20%).

387

388

The next stage is referred to as Lemmatization. Lemmatization of the corpus was conducted based on the English dictionary, in order to group singular and plural forms under a single form, as well as revert the conjugated verbs into their infinitives. The results of lemmatization showed a decrease in the number of HAPAX forms to 45.14% and the type/token ratio to 6,85% thus rendering the text analysis more stable.

The purpose of this procedure is to render different versions of functionally equivalent words synonymous, so that they are not treated as separate entities in the analysis (Motumbo, 2013). Afterwards, a Hierarcical Descending Classification (HDC) of ICUs was performed based on the entire lexical table (Reinert, 1983), taking into account the following variables: *First Author, Country of birth, Country at the moment of article publication, Journal of publication, Year, Typology of article (Empirical or Theoretical), and whether the contribution is informed by a postcolonial approach (YES or NO)* with the purpose of exploring if certain clusters were specific to a certain county, period of time and resource type.

Results and Discussion

415 Descending Hierarchical Clusterification

416
 417 The subsequent phase of corpus processing is referred to as Parsing of the text into
 418 “Context Units”(Stoneman, 2015). Categorization of the data was performed after
 419 sizing the text segments, clusterified according to their vocabularies. The text clusters
 420 were generated as shown in Fig. 2, where the dendrogram of the Descending
 421 Hierarchical Clusterification (DHC) is illustrated. The order of the words varies
 422 according to the chi square coefficient: the higher the order of appearance, the higher
 423 the contribution of the word to the organization of the cluster.

424
 425
 426 Fig. 2 Dendrogram of the clusters as produced by IRaMuTeQ
 427

428
 429
 430
 431 Upon reading the corpus and referencing back to the original publications, the logic
 432 between the classification performed by the software comes forth and we proceeded to
 433 interpret the results basing on this type of content analysis, similarly to the procedure
 434 employed by Chaves et al in 2017.

435 The software provided the most characteristic segments of text from each cluster (corpus
 436 in color, also known as “corpus cooler”), according to a clusterification based on the
 437 distribution of vocabulary, which allowed us to contextualize the typical vocabulary in
 438 each cluster. The descending clusterification technique maximizes the similarity between
 439 statements in the same cluster and also maximizes the difference between the clusters.

440 As shown in Fig. 2, the corpus was divided into six sub-corpora. Clusters 2 and 3 consist
 441 together of 214 Elementary Context Unit (ECU) which concentrate respectively 12,3%
 442 and 14,8% of the total ECUs of the corpus, forming two semi-detached related sub-
 443 corpora. Thus, in order to critically interpret social psychological literature production,
 444 we went through the identification of core meanings in each thematic category shown.
 445 The core meanings were identified in each cluster originated in the dendrogram, as well
 446 as in the relationships between the clusters and the words frequency within each cluster.
 447 The chi-square test is used to verify the association of ECU with a particular cluster
 448 (therefore, the higher the value, the greater the association), while the percentage refers

449 to the occurrence of words in the text segments in that cluster in relation to its
 450 occurrence in the corpus.

451 To aid the interpretation of what the semantic structures and discourses underlying the
 452 substantive clusters formations are, Table 2 shows the most common words defining
 453 each cluster. All of the selected words had a $p > 0.001$, indicating a significant
 454 association, (Chartier and Meunier 2011).

455
 456 Table 2: Common words within the substantive IRaMuTeQ clusters by chi-square (X2) and frequency of
 457 the term in the clusters
 458

Cluster	Word	X2	Percentages %
Cluster 1 20.8% (n = 109)	racism	45.49	63.16
	racial	30.16	72.22
	aversive	27.08	100.00
Cluster 2 14.8% (n = 97)	outgroup	82.13	88.89
	guilt	71.68	56.52
	apology	40.36	81.82
Cluster 3 12.3% (n = 117)	memory	71.84	91.67
	collective	59.56	52.78
	mediate	42.57	87.50
Cluster 4 21.1% (n = 120)	world	44.58	75.00
	psychology	37.42	55.32
	narrative	26.68	100.00
Cluster 5 16% (n = 97)	influence	33.01	63.16
	psychology	32.54	44.68
	cultural	28.67	47.22
Cluster 6 15% (n = 117)	Maori	83.36	76.92
	national	77.05	65.71
	Zealand	70.60	77.27

459
 460
 461 Cluster 2 is defined by a discourse referring to emotions evoked by acknowledgment of
 462 past sufferings and by the discourses focusing on *apologies* and *compensation* for the harm
 463 done. Members of former colonized groups are perceived as having been harmed.
 464 Representative statements within this cluster include “*we found that the experience of group-*
 465 *based guilt due to colonial conflicts can be positively predicted by outgroup perceptions*”, “*An*
 466 *examination of potential outgroup-focused predictors of group-based guilt relating to past colonial conflicts*
 467 *involving...*”.

468 The recurrence of the words “memory”, “collective”, “generation”, “mediation” and
 469 “manipulation” which openly refer to experimental research methods define cluster 3.
 470 Both clusters refer to intent for *reparations*, but while cluster 2 is more focused on the role
 471 of moral emotions, cluster 3 takes in account the generational transition of a grievous
 472 past. The mainstream experimental method being difficult to match with the
 473 epistemology of postcolonial theory, those clusters point to the fact that the present is
 474 left out from a postcolonial perspective and only addresses colonial issues of the present
 475 through the lense of classic psychosocial perspectives.

476 Shifting to the other branch of the dendrogram, we may note that Cluster 4 and 5 are
 477 confronted with Cluster 1, which in turn all together represent two encapsulated sub-
 478 corpora differentiated from Cluster 6.

479
 480 While Cluster 6 refers to basic features of New Zealand’s research tradition such as:
 481 Maori, Pakeha, biculturalism, nationhood. This line of research has a long standing

482 tradition of close affiliations to the UK, US and European scientific communities, due to
483 the migration of the first generation of social psychologist from Europe and North-
484 America. Moreover the professional bounds those areas were maintained along the year,
485 as it is illustrated by the development of Social identity Theory, initiated by Henri Tajfel
486 and John Turner (respectively, a British and an Australian Social Psychologist), and its
487 related constructs. As such, New Zealand and Australian research traditions were mainly
488 fertilized within a field where the main thematic areas were traditionally the study of
489 social identity and inter-group relations: Chris Sibley, a New Zealander social
490 psychologist who studied how in post-colonial nations the socio-structural conditions
491 lead to the development two types of ideology, went on researching specific objects of
492 study, such as biculturalism and relation between Maori and Paheka. Of course, the
493 choice of objects of study is in line with the social issues that this geo-cultural context
494 has been facing such as the multi-cultural character of the population. Then, additional
495 words defining this cluster are: opposition, nationhood, symbolic, dominant, negation.
496 Moreover the ideological duo stated by Sibley (2010) which refers to the way social
497 inequality becomes legitimized, through the historical negation of the contribution of
498 minority groups to the national identity (Sibley, 2010) has given rise to a potentiality for
499 capturing post-colonial phenomena. Yet, an anti-colonial perspective, taken by most
500 researcher in the Oceanian context (versus post colonial perspective) does not warrant
501 the methodological adjustments which would fully grasp the ongoing unequal social
502 structures of said context – although researchers are critical of the consequences of
503 colonialism, their approach fully adheres to the existing psychosocial concepts and
504 theories, thereby excluding the contributions of indigenous psychology to scholarly
505 work.

506
507 Cluster 4 together with cluster 5 refers to *indigenous psychology* as an *emergent* discipline
508 understood as a form of *liberation*, addressing *local* issues revolving around *challenging views*
509 around the *world*. It is interesting to note that cluster 4 is the cluster in which Postcolonial
510 Theory has most frequently appeared as a used term, emphasizing the connection
511 between postcolonial theory and the liberating agendas of its cross-fertilization with
512 indigenous psychology. As for Cluster 5, it consists in what appears to be coherent with
513 qualitative research methods, which open up to *critical* and *cross-cultural psychology* with an
514 explicit mentioning to a postcolonial approach. Finally, Cluster 1 can be described in
515 terms of *black* and *white* categorical opposition, with a focus on psychosocial phenomena
516 such as *racism*, *prejudice* and *bias*, resuming constructs related to social cognition.

517 Moreover, IRaMuTeQ generated a contingency table, which outlines the clusters, and
518 associated key words can be presented graphically as a correspondence plot, which will
519 identify similarities and/or differences between the clusters.

520 A correspondence plot locating similarities/differences between the clusters has been
521 generated as a graphical illustration of the contingency table outlining the clusters and
522 associated key words. On Figure 1, we can see that Clusters 2 and 3, recounting the role
523 of moral emotions resulting from an acknowledgment of the past, are on the right hand
524 side of the chart, while Clusters 4 and 5, relating to an approach to a more universally-
525 oriented, indigenous perspective on coloniality, and which are more anchored within a
526 qualitative research framework, appear on the left. Thus, we can think of Cluster 1, “the
527 Conflict Cluster”, as being positioned on a medial dimension, as conflict is a historical
528 constant. The accurate description in class 3 is the most distinctive class, in terms of its
529 distance to the middle of both horizontal and vertical axes, and in terms of the distance
530 between it and the other classes.

Correspondence Analysis

In a final stage of IRaMuTeQ analysis, we present the set of derived clusters cross-tabulated with the words from the corpus and subjected to a correspondence analysis. This is a geometric technique for visualizing the variation in a contingency table in a low-dimensional space (Greenacre, 2007) and can be thought of as analogous to a principal components analysis for categorical variables. The output from this analysis can be used to identify the proximity of words and clusters to each other along the key dimensions of variation.

 563

What we can observe are two sets of clusters: Cluster 2 and 3 offer a general look on a European tradition focused on intergroup emotions between former colonized and colonizers' group members and related sociopsychological phenomena mainly induced through an evocation of past (colonial) episodes. Guilt and shame are still at the core of this literature production and while concepts such as compensation and reparation are taken into account, it seems they are not embedded in any critical discourse aimed at disrupting or at least pointing at contemporary colonizing practices in favor of knowledge that might foster liberation agendas. Rather, the ethical mentality stemming from the deployment of moral emotions certainly allows for a retrospective glance that highlights the suffering of victims unfairly inflicted over centuries by ancestors, but the representation of the past, which is taken into account, looks entangled in an evaluative dimension, without reference to aspects of postcolonial societal structure.

As shown in Figure 3, the past is characterized by a co-occurrence with words such as: guilt, group, emotion, anger, perception, responsibility, outgroup, ingroup, colonial, etc.

597

Chi-Square Test of Independence

598 In order to obtain a complete set of information related to our corpora, as stated before,
599 we were able to retrieve meta-data related to *First Author*, *Country of Birth of the First Author*
600 (found through an online search), *Location of his/her Institutional Affiliation*, *Journal of*
601 *Publication*, *Year of Publication*, data related to the use of *Postcolonial theory* (Yes or No) and
602 whether the publication under analysis is *Empirical or Theoretical*.

603 As mentioned in the introduction, the use of a postcolonial perspective implies a certain
604 methodological preference since work of a more empirical nature is based on a
605 qualitative approach (fieldwork, ethnography, narrative and interviewing). As
606 “quantitative methods are generally used in mainstream social psychological research”
607 (Griffin and Phoenix, 1994), we hypothesized the “Country of Birth” of the first author
608 combined with a theoretical framework would predict a postcolonial perspective.

609 Indeed, our choice of variable (“Country of Birth”) was prompted by the fact that a
610 scholar’s academic interests obviously could not have been fabricated in a vacuum.
611 Rather, individual theoretical preferences and academic interests are closely tied to a
612 scholar’s personal history, family background, etc. Consequently, the country of birth
613 might hold explanatory power for predicting scholars’ academic orientations.

614
615 As for the variable “Empirical (coded as 1)/Theoretical (coded as 2)”, our choice was
616 incentivized but the fact that the trend for many authors, when focusing on an empiricist

617 research orientation, is to “regard empirical facts as the ultimate goal of scientific
 618 research” whether it is to “(survive) in a particular field of the scientific community” or
 619 to “compete with others” (Kwang-Kuo Hwang, 2013). In their scientific approaches,
 620 mainstream (social) psychologists rarely address the deep structure behind the observed
 621 phenomena in a culture.
 622

623 Using Intellectus Statistics version 1.01, a Chi-Square Test of Independence was
 624 conducted to examine whether Country of birth and explicit use of Postcolonial Theory
 625 were independent. There were 2 levels in Country of birth: C and P. There were 2 levels
 626 in the use of Postcolonial Theory: No and Yes.
 627

628 **Results.** The results of the Chi-square test were significant, $\chi^2(1) = 10.31, p = .001$,
 629 suggesting that Country of birth and Use of Postcolonial Theory are related to one
 630 another. The following level combinations had observed values that were greater than
 631 their expected values: C:No and P:Yes. The following level combinations had observed
 632 values that were less than their expected values: P:No and C:Yes. Table 1 presents the
 633 results of the Chi-square test.
 634

635 Table 1
 636 *Observed and Expected Frequencies by Country_of_birth and PostColTh_Yes_No*
 637

Country_of_birth	PostColTh_Yes_No	
	No	Yes
C	64 [57.56]	20 [26.44]
P	10 [16.44]	14 [7.56]

638 *Note.* $\chi^2(1) = 10.31, p = .001$. Items in brackets represent expected cell frequencies.
 639

640 Another Chi-Square Test of Independence was conducted to examine whether Empirical
 641 or Theoretical Articles and the use of Postcolonial Theory were independent. There were
 642 2 levels in Empirical/Theoretical: E and T. There were 2 levels in the use of Postcolonial
 643 Theory: No and Yes.
 644

645 **Results.** The results of the Chi-square test were significant, $\chi^2(1) = 4.73, p = .030$,
 646 suggesting that Empirical/Theoretical and Use of Postcolonial Theory are related to one
 647 another. The following level combinations had observed values that were greater than
 648 their expected values: E:No and T:Yes. The following level combinations had observed
 649 values that were less than their expected values: T:No and E:Yes. Table 2 presents the
 650 results of the Chi-square test.
 651

 658
 659

660

661

662

663 Binary Logistic Regression

664

665 Finally, a binary logistic regression was conducted to examine whether “Country of
666 birth” and “Empirical/Theoretical” variables related to each contribution considered in
667 our corpus had a significant effect on the odds of observing the Yes category of “Use of
668 Postcolonial Theory”. The reference category for “Use of Postcolonial Theory” was No.
669 Variance Inflation Factors (VIFs) were calculated to detect the presence of
670 multicollinearity between predictors. Variance Inflation Factors greater than 5 are cause
671 for concern, whereas VIFs of 10 should be considered the maximum upper limit
672 (Menard, 2009). All predictors in the regression model have VIFs less than 10. Table 1
673 presents the VIF for each predictor in the model.

674

675 Table 1

676

677 *Variance Inflation Factors for Country_of_birth and Empirical_Theoretical*

678

Variable	VIF
Country_of_birth	1.01
Empirical_Theoretical	1.01

679

680 **Results and Discussion**

681

682 The overall model was significant, $\chi^2(2) = 14.29, p < .001$, suggesting that “Peripheral
683 Country of birth” (coded as 2) and “Theoretical Articles” (coded as T) had a significant
684 effect on the odds of observing the Yes category of “Use of Postcolonial Theory”.
685 McFadden's R-squared was calculated to examine the model's fit, where values greater
686 than .2 are indicative of models with excellent fit (Louviere, Hensher, & Swait, 2000).
687 The McFadden R-squared value calculated for this model was 0.11. The regression
688 coefficient for “Peripheral Country of birth” was significant, $B = 1.53, OR = 4.62, p =$
689 $.002$, indicating that for a one unit increase in “Peripheral Country of Birth”, the odds of
690 observing the Yes category of “Use of Postcolonial Theory” would increase by
691 approximately 362%. The regression coefficient for “Theoretical Articles” was
692 significant, $B = 0.95, OR = 2.59, p = .034$, indicating that for a one unit increase in
693 “Theoretical Articles”, the odds of observing the Yes category of “Use of Postcolonial
694 Theory” would increase by approximately 159%. Table 2 summarizes the results of the
695 regression model.

696

697

698 Table 2

699

700 *Logistic Regression Results with Country_of_birth and Empirical_Theoretical Predicting*
701 *PostColTh_Yes_No*

702

Variable	B	SE	χ^2	p	OR
(Intercept)	-3.10	0.73	18.25	< .001	
Country_of_birth2	1.53	0.50	9.31	.002	4.62
Empirical_TheoreticalT	0.95	0.45	4.48	.034	2.59

703 *Note.* $\chi^2(2) = 14.29, p < .001, McFadden R^2 = 0.11.$

704

1 705 According to our results, the country of origin (coded as “Core: 1/Periphery: 2”) is a
2 706 strong predictor for those social psychologists interested in issues of colonialism,
3 707 coloniality and postcoloniality who make use of postcolonial theory in their research. The
4 708 theoretical appeal of postcolonial studies, although seen in a minority of articles, appears
5 709 to be strongly correlated for those scholars who are either born in a “Peripheral
6 710 Country” and affiliated to a university located in a former colony, or who are affiliated to
7 711 a university from a “Core Country”, but were born in “Peripheral” one. These results
8 712 support the idea, that although “there remains (within academia) a general lack of
9 713 support for the inclusion of subjugated knowledge, paradigms, and methodologies”,
10 714 while well-intentioned western scholars often “unwittingly participate in the Western
11 715 hegemonic process,” (Semali and Kicheloe 1999), “efforts are merely tokenistic gestures
12 716 to deal with diversity in what remains a western hegemonic curriculum” (Waterfall and
13 717 Maiter, 2003).

14 718

15 719 As our results seem to confirm, this research orientation, when tackling issues of
16 720 coloniality, appears not to foster a culture-inclusive theory of psychology or the “deep
17 721 structures” behind the empirical phenomena which postcolonial theory could reveal.
18 722 Although using similar concepts and constructs, postcolonial theory looks beyond the
19 723 conventional paradigms of psychological subdisciplines, and could thereby greatly
20 724 contribute to progress in empirical psychological research.

21 725

22 726

23 727 **Strengths and Limitations of the Review**

24 728

25 729 To our knowledge, a thematic analysis of literature focusing on the sociopsychological
26 730 analyses of postcolonial issues had never been performed. Clarifying their similarities and
27 731 differences, we hope to encourage the cross-fertilization of the theoretical and
28 732 methodological tools used to tackle the issues of colonialism and coloniality, as well as to
29 733 encourage further developments within those fields.

30 734

31 735 Exploiting the computer-assisted text analysis resources of IRaMuTeQ, a fairly novel but
32 736 promising technique for which literature is still scarce, we hoped to facilitate the use of
33 737 this open-source alternative to ALCESTE within the community of researchers
34 738 conducting textual analyses.

35 739

36 740 As with any method of literature review, the thematic analysis of literature process has its
37 741 limitations. We identified below some of the relevant limitations to this review including:
38 742 the exclusive choice of articles as a source of analysis; inaccessible publications; choice of
39 743 variables and timeframe restrictions.

40 744

41 745

- 42 746 • A certain number of publications have been published in the form of books,
43 747 which have a higher frequency of mentioning Postcolonial Theory. But as articles
44 748 are the preferred form of publishing, and in order to harmonize our corpus, we
45 749 selected articles as more representative of the state of the art within the selected
46 750 field.

- 47 751 • While we made every effort to include all materials relevant to our research
48 752 questions, some publications may not have been included due to a restricted
49 753 access to the databases. Moreover, not all references are available in a digital form

50 754

51 755

52 756

53 757

54 758

55 759

56 760

57 761

58 762

59 763

60 764

61 765

62 766

63 767

64 768

65 769

753 and obtaining these texts proved time-consuming, particularly when operating
754 within a restricted timeframe.

755 • We selected “First Author” as a variable but acknowledge that co-authors might
756 influence the approach taken in the article, in particular in cases of
757 interdisciplinary research that brings along different approaches. Again, for
758 reasons of comparability, as well as time restriction (the search of countries of
759 birth proved to be time-consuming), we selected First Author as the most
760 influential as regards the theoretical and methodological choices within the
761 papers.

762 As for the exploratory nature of our analysis, confirmatory analysis should follow, in
763 order to provide us with more definitive answers to the areas of interest identified with
764 our study.

765

766

767 **Conclusions**

768

769 Psychology, as an academic field originated from Western knowledge systems and
770 frameworks (Huang, Li-Li, 2012). As we have recently witnessed, a growing corpus of
771 research articles within social psychology and adjacent disciplines focusing on legacy of
772 colonialism from former colonizers and colonized perspectives, we have found our
773 driving question extremely relevant: how are discourses within the sociopsychological
774 disciplines that are revolving around issues of coloniality articulated? Are these ways of
775 thinking and proceeding still instilled by colonization?

776 As mentioned before, content analysis of cluster 2 and 3, obtained by the IRaMuTeQ
777 clusterification (DHC), have disclosed a line of academic reasoning that should be
778 further developed by scholars, touching upon a way to frame interactive account of the
779 relationship between groups, as characterized by a certain diachronicity, which brings to
780 notice the conception of a moral emotions.

781

782 As remarked by anthropologist Terray (2005), an African specialist, descendants of
783 slaves, populations decimated if not exterminated by genocide, natives of the Republic
784 who have suffered from Colonialism at the very least demand the symbolic recognition
785 of their sufferings (Moscovici and Perez 1995).

786 Consequently, relationship between groups become entangled by the mutual bond of
787 repentance and demanding for compensation, permeated by emotions such as guilt and
788 shame. Especially in the light of the normative change generated in the '60 with the
789 advancement of civil rights movement, and the political turn of the declaration of the
790 rights of men, how do former colonizer group members face the social undesirability
791 that has since then suppressed manifested discriminatory behavior?

792 Content analysis of cluster 2 and 3, which helped us to contextualize the typical unit of
793 the class generated by clusterification, shows a strong interest of European academics to
794 these issues: the most significant words deal with past-oriented terms such as guilt and
795 apology and compensation. No reference is given to ideology or to aspects that could
796 relate such inter-group dynamics to the larger frame, that is to the impact on the social
797 inequality. Upon referencing back to the original publications, the interpretations of the
798 clusters became meaningful, given the correspondence that we found between them and
799 clusters' contents. What still remains to be done is to assess the strength of this moral
800 emotions in order to change those representations which still objectify the descendants
801 of the colonized out-group members, placing them outside the societal mainstream. Do

802 the negative representations of the colonial past held by former colonizer group
803 members make them more or less likely to believe that they are nowadays accountable
804 for the atrocities of colonialism in the past? And what about the practice of appealing for
805 compensation by the descendants of the colonized? Is that the road to empowerment or
806 to dependence?
807 The emergence of indigenous psychologies (cluster 4 and 5) and the stabilization of New
808 Zealand and Australia research traditions echo these issues precisely.
809 As we have discussed, New Zealanders and Australian researchers, who emerged as the
810 literature of reference behind cluster 6, have adapted to hot societal issues, with a glance
811 to representations of history and the issue of social inequality, while keeping close to its
812 original tenets.
813 As for indigenous psychology, distinct from other culture-oriented branches of
814 psychology (cultural and cross-cultural), indigenous psychologies have developed in
815 different parts of the world – often in former colonized countries – as a response to the
816 domination of Occidental mainstream psychology (Licata, 2010). The DHC
817 clusterification for cluster 4 and 5 refers to indigenous psychology as an emergent
818 discipline understood as a form of liberation, addressing local issues revolving around
819 challenging views around the world, which open up to critical and cross-cultural
820 psychology with an explicit mentioning to a postcolonial approach. This is coherent with
821 what is advocated by those indigenous psychologists who use qualitative and
822 ethnographic methods to collect data on some culture-specific phenomena (Huang,
823 2012). Nonetheless, despite these scholars’ efforts who advocate for a bottom-up
824 approach, others indigenous scholars still insist on using “scientific” quantitative
825 psychological methods such as surveys and experiments, because the discipline of
826 scientific psychology asks for empirical verification or falsification of theoretical
827 propositions (ibidem). However, DHC points to the fact that when the issue of
828 coloniality is addressed, indigenous scholars take on a qualitative, bottom up approach.
829 In fact, as it shown in our binary logistic regression analysis, the theoretical appeal of
830 postcolonial studies appears to be strongly correlated with scholars born in a “Peripheral
831 Country”, suggesting a core/periphery “disciplinary partitioning”. But “much
832 postcolonial theory is explicitly psychological in both its concerns and its critical
833 resources; the further contribution of more precisely tailored psychological perspectives
834 to postcolonial theory is therefore warranted.” Despite many scholars’ efforts it seems
835 researchers build their theories by embracing the absoluteness of their field. As for social
836 and critical psychology, it seems “(their) agendas of political activity remain of a
837 particularly limited sort” (Hook, 2005). Nevertheless, Okazaki (2008) holds an optimistic
838 view, stating that “a collaboration between psychology and postcolonial scholars holds
839 one promising avenue for psychology to theorize and examine culture in ways that are
840 responsive to complexity of social and psychological lives. Furthermore, while
841 appreciating the historical contours of the birth and development of indigenous
842 psychologies, we call for a rich conversation between the very histories that gave rise to
843 the conditions of their birth and their sometimes problematic practices. Clearly, the
844 discipline and practice of psychology, like the peoples it aims portray and serve, are all
845 products of the same histories central to the approach to self-determination and cultural
846 healing.”
847 By engaging in a more critical reading and writing as "resistance", seen as the interplay of
848 cultural analysis and political commitment against all forms of colonialism and
849 imperialism, social psychologists could enrich the postcolonial perspective with
850 additional methodological tools, greatly benefit their discipline, and society at large,
851 hopefully as part of a wider process of interdisciplinarity and cosmopolitanism. As Kuhn

1 852 proposed “We do not improve our knowledge of the world through systematic study so
2 853 much as shift our way of seeing the world.” (Quoted from Gergen, 1992).
