

Supplementary Figure 1. Whole genome phylogeny for *S. Typhi* global collection in relation to the Roumagnac *et al.* haplotyping scheme¹. (a) Roumagnac's global population structure of 105 *S. Typhi* based on SNPs in 199 gene fragments (88,739 base pairs)¹. The tree shows 59 haplotypes (nodes) based on 88 alternative allelic states (biallelic polymorphisms; BiPS) with the four primary clusters (1-4) indicated by colors. Nodes that fall within the Clades 0.1, 2.5, 3.1 and

4.3 are highlighted by color ovals. H45 represents the ancestral root node (black circle with red border). **(b)** Whole genome phylogeny for *S. Typhi* global collection, showing haplotypes based on Roumagnac scheme and new clade genotypes. Tree shows maximum likelihood phylogeny for the global collection, based on genome-wide SNP calls. Branches are colored and labeled by clade as defined in this study. Outer colored ring shows 85 haplotypes in randomly assigned colors, using the scheme proposed in Roumagnac *et al*, 2006¹. Major haplotypes are labeled. NT = non-typeable.

Supplementary Figure 2. Distribution of each clade by continent.

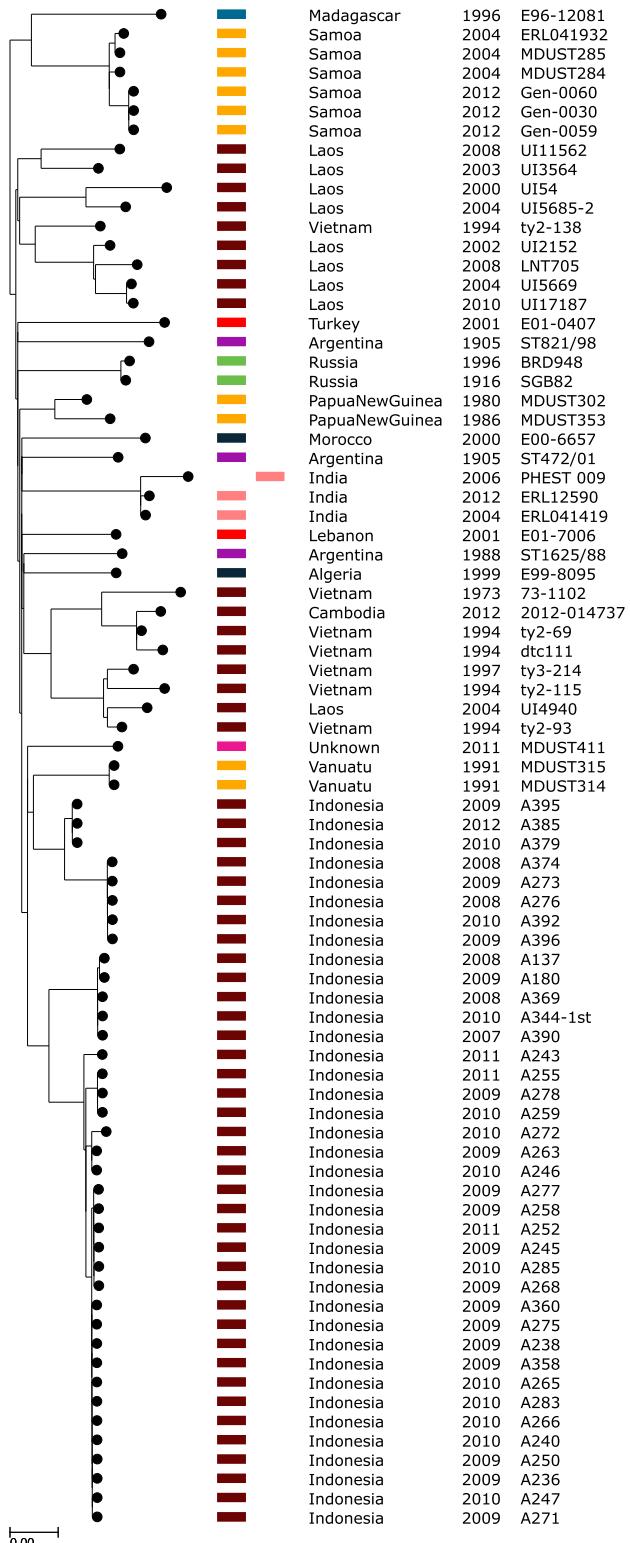

S. Typhi isolates of the same subclade, country and year were collapsed into a single representative, to reduce the impact of localized outbreaks on our collection (n=541 non-outbreak isolates). In addition to the 16 clades, the geographical distribution of isolates assigned to the cluster level but not further differentiated into clades are also shown (labeled in brackets).

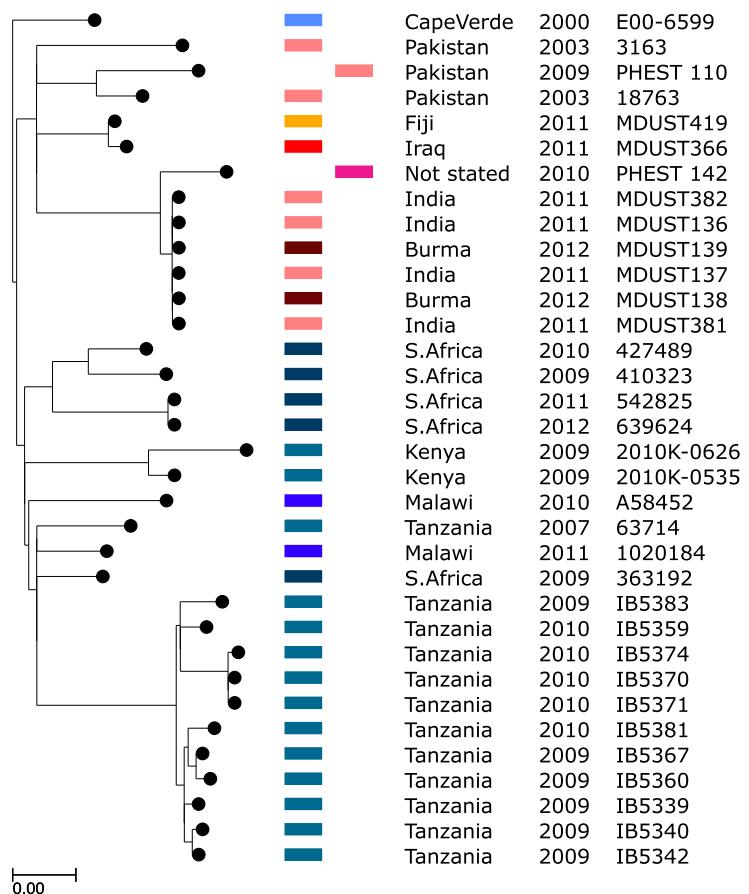

Supplementary Figure 3. Frequency of country matches between closest related isolates. Relationship between the proportion of *S. Typhi* isolates with closest strain from same country and the SNP distance to the closest strain. Solid black line = mean value; red dashed line = 95% confidence interval.

Supplementary Figure 4.

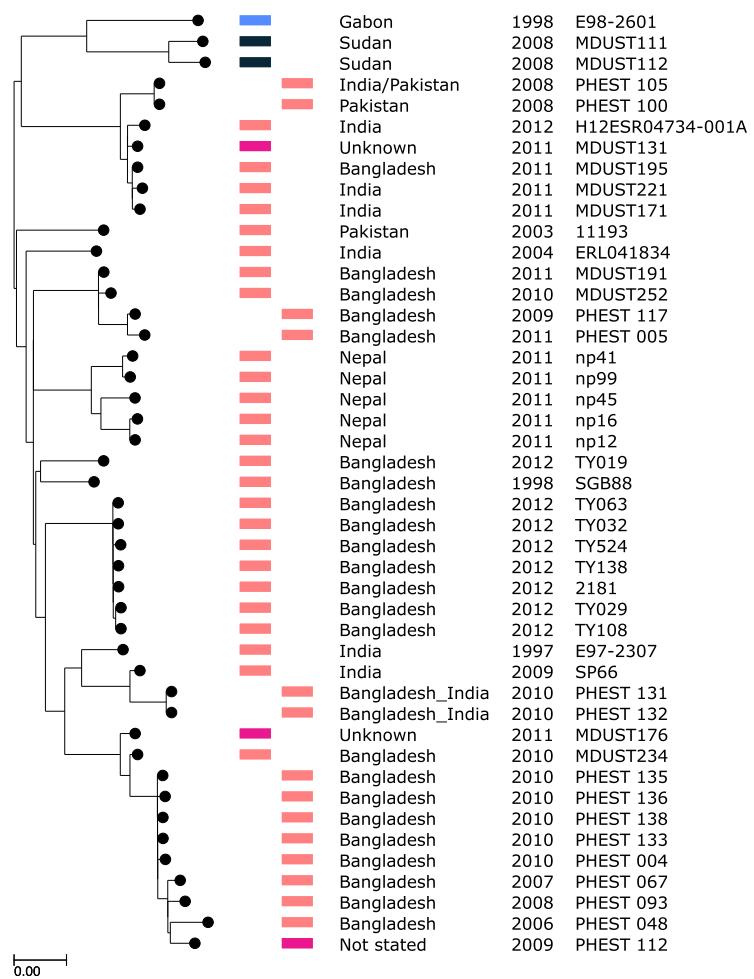

(a) Genotype 4.1.0

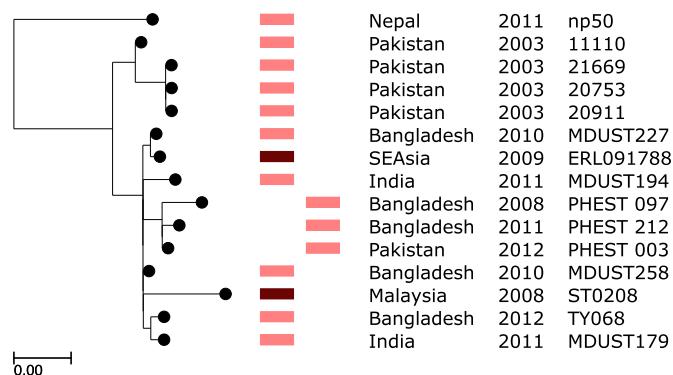

(b) Subclade 3.3.1

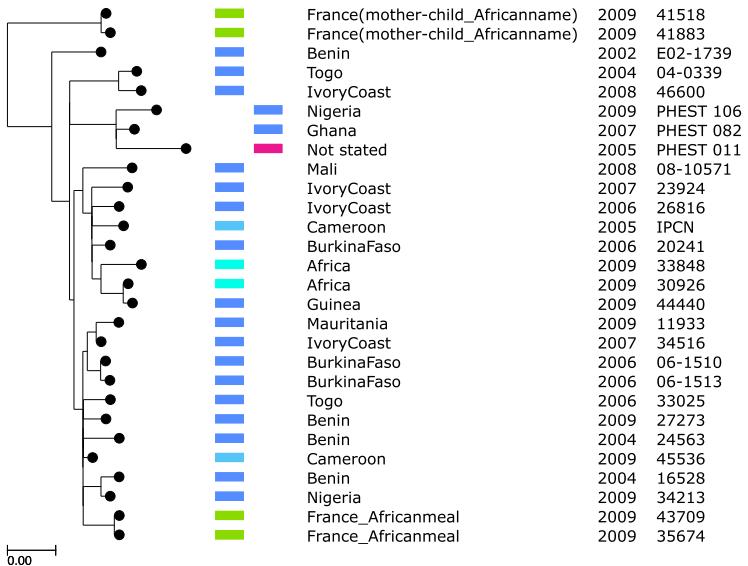

(c) Genotype 3.3.0

(d) Subclade 3.2.2

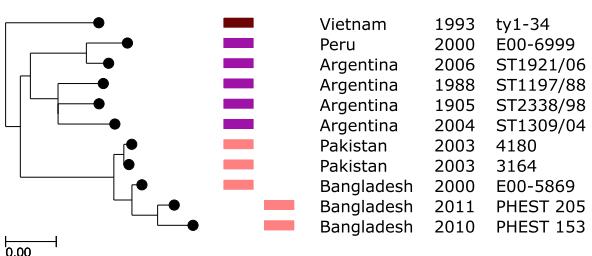

(e) Subclade 3.1.1

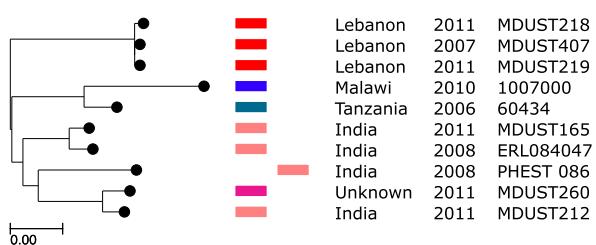

(f) Subclade 3.0.1

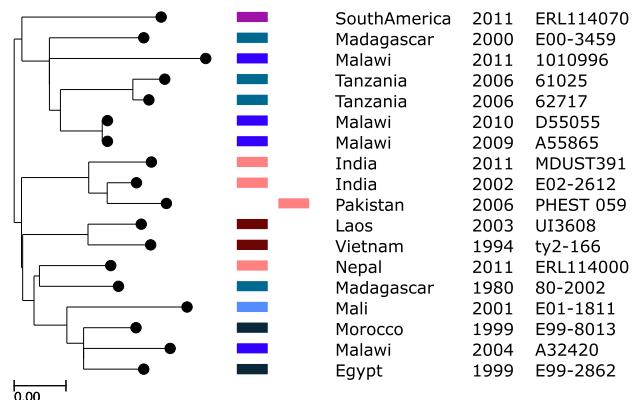

(g) Subclade 2.3.3

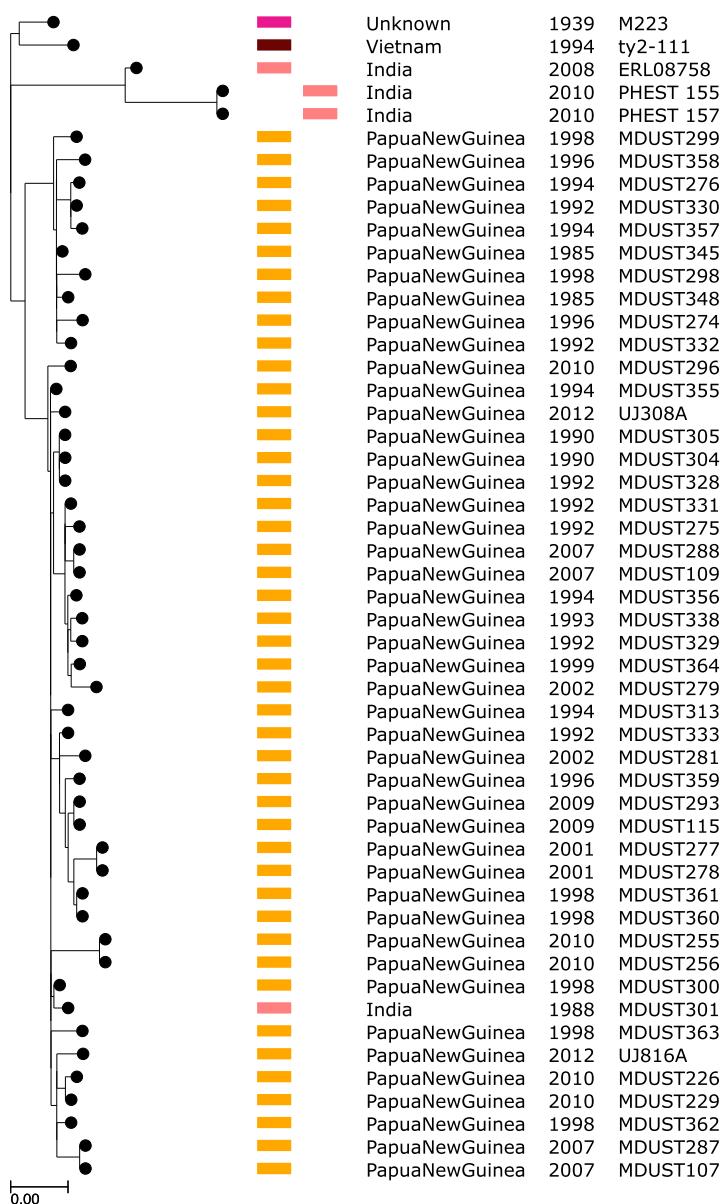

(h) Subclade 2.2.2

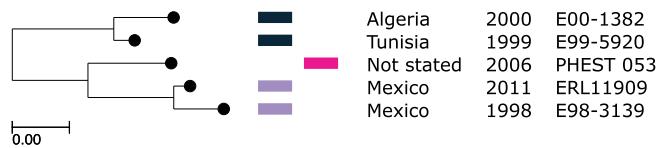

(i) Genotype 2.2.0

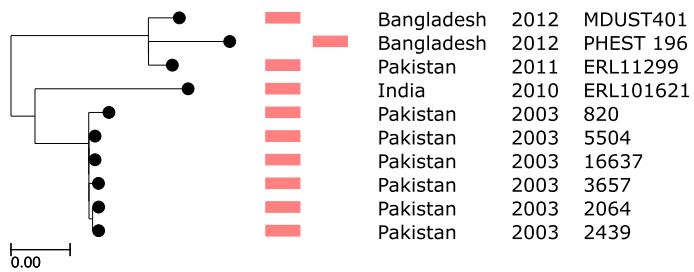

(j) Subclade 2.1.7

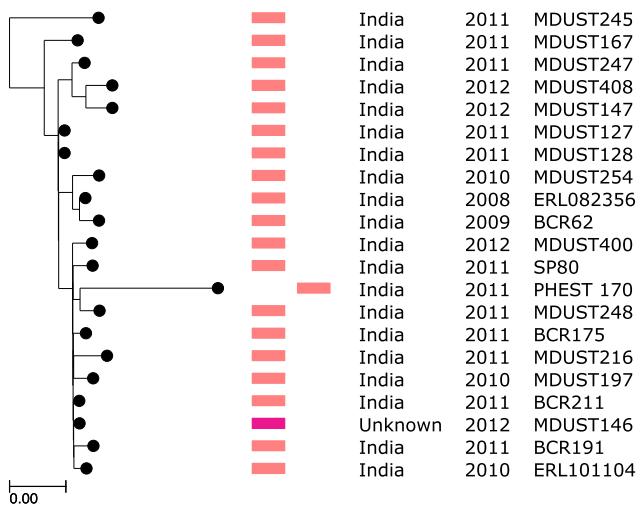

(k) Subclade 2.0.2

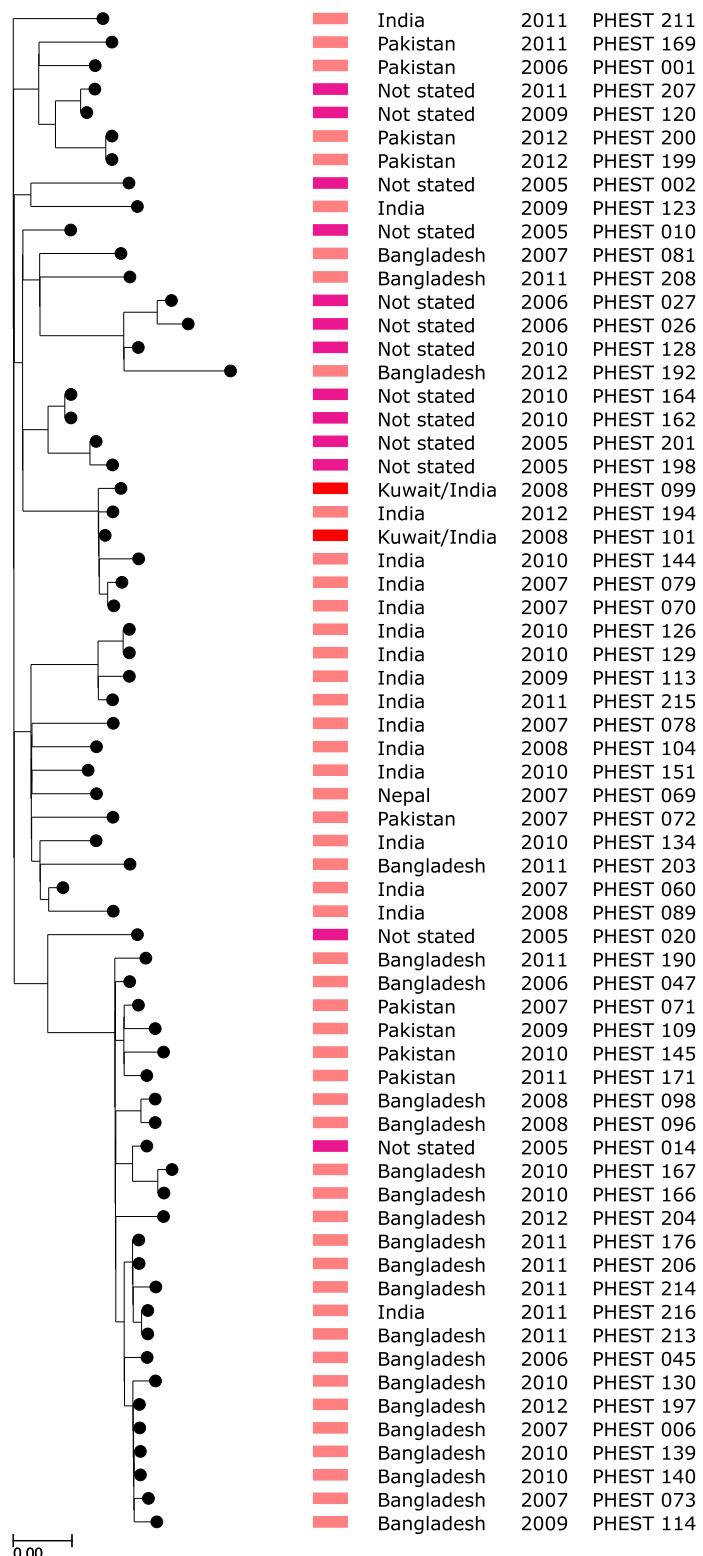

(l) Subclade 2.0.1

(m) Subclade 4.3.1 – singleton isolate

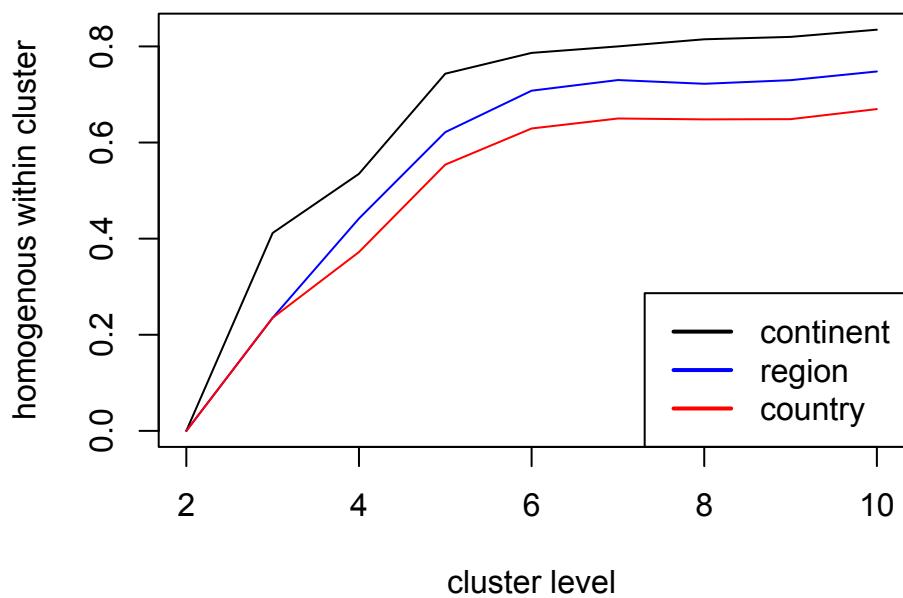

(n) Subclade 4.3.1 – travel-associated isolates subgroup

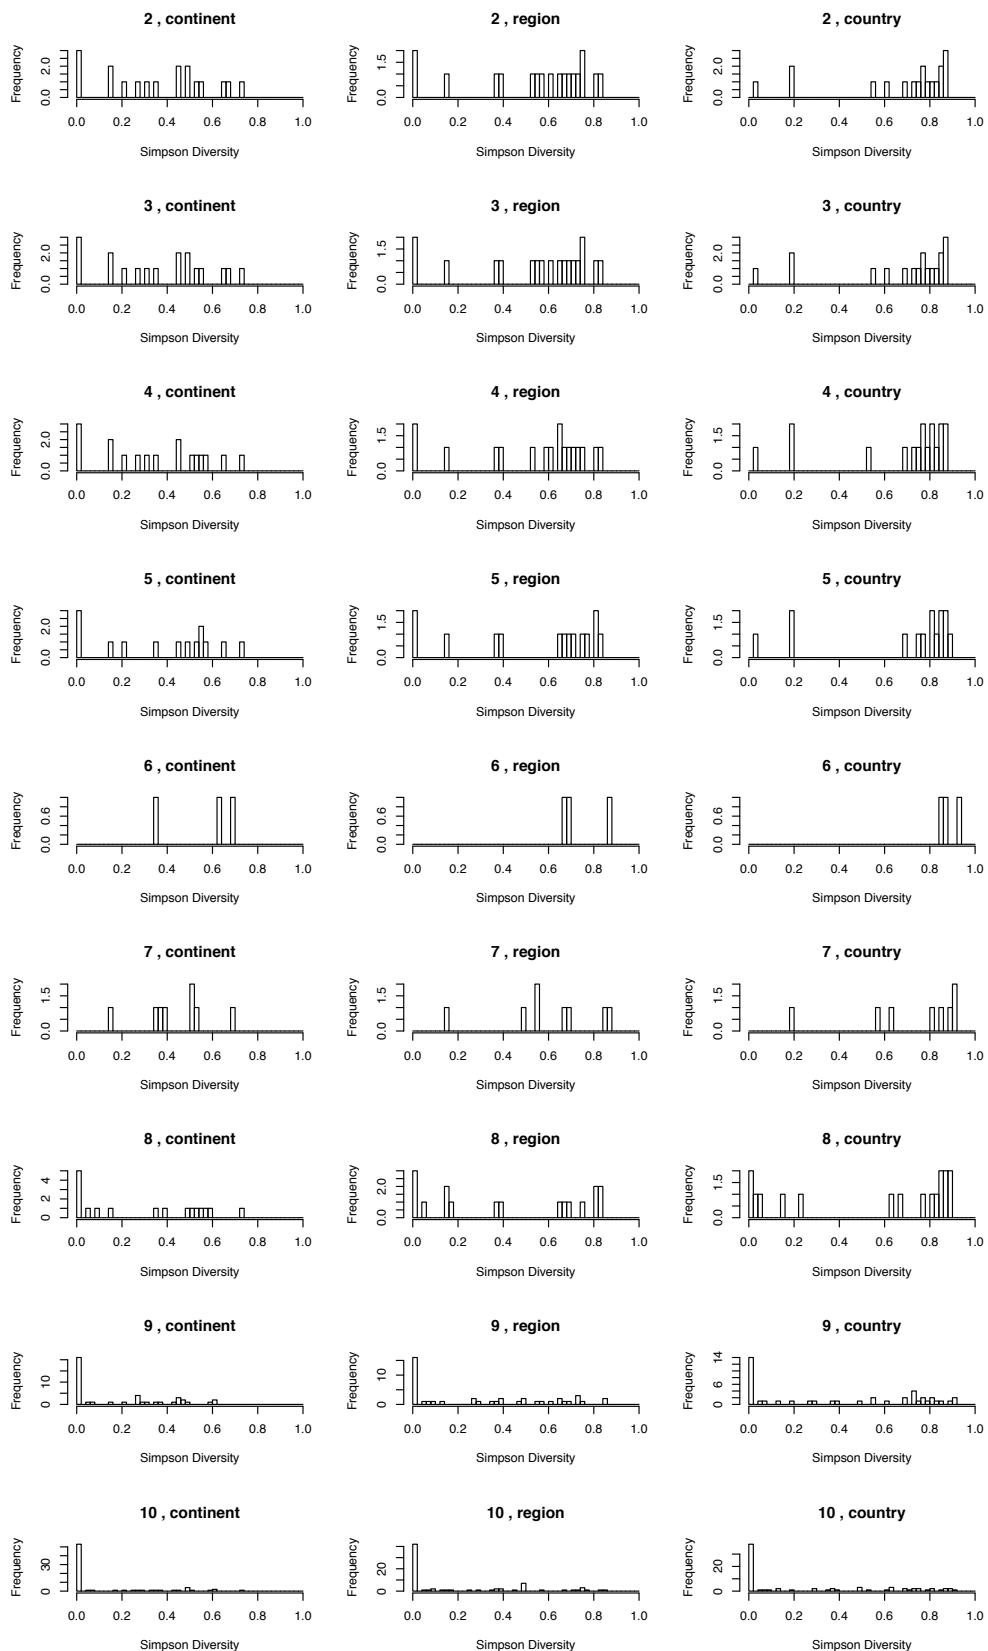

Supplementary Figure 4. Phylogenetic trees for subclades with travel-associated *S. Typhi* isolates. Each subclade with travel-associated isolates is shown (a) to (n). Tree backbone showing *S. Typhi* isolates labeled by colored bars with respect to country of origin from our global collection (first column) and travel-associated isolates (second column). For each isolate the country (third column),

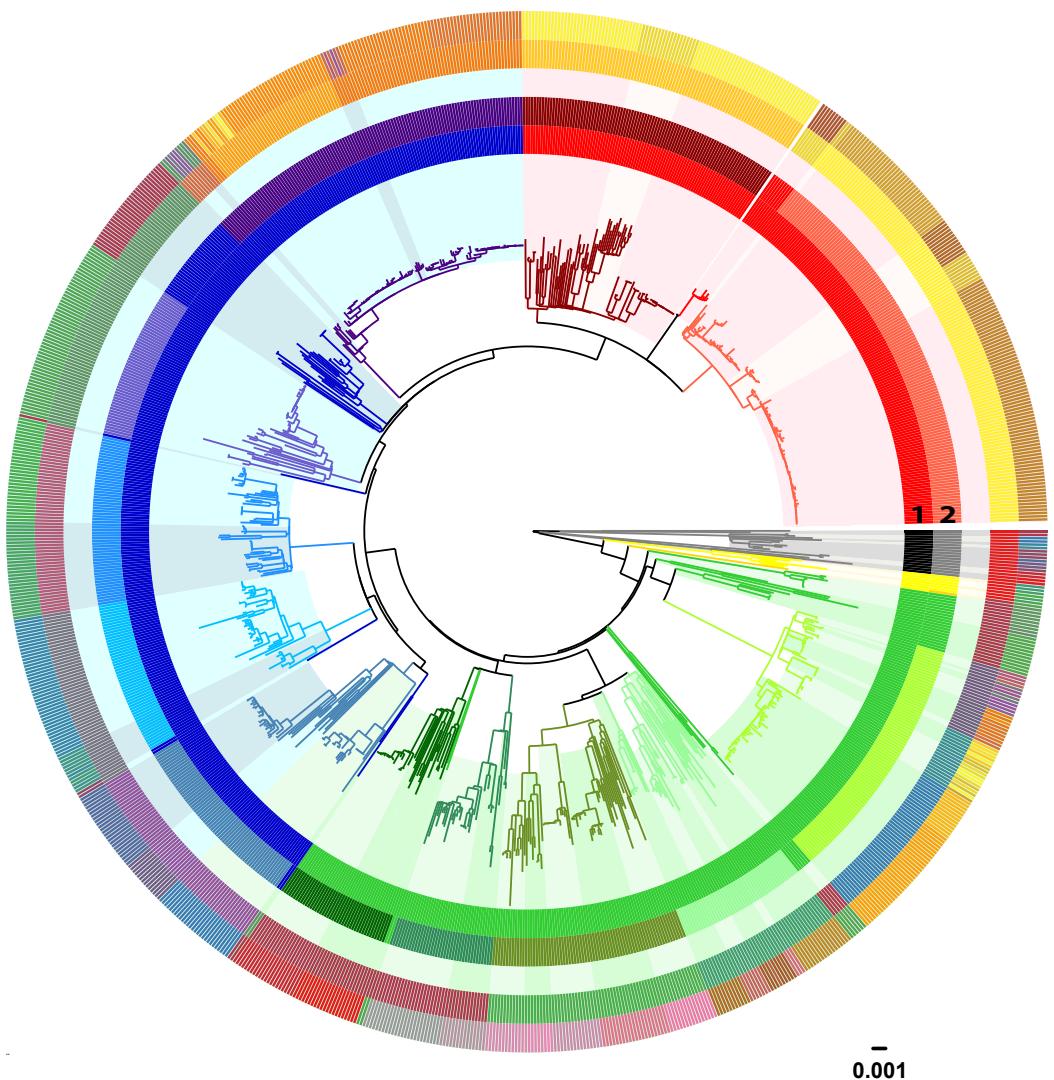

year (fourth column) of isolation, and original laboratory number (fifth column) are also indicated.

Supplementary Figure 5. Homogeneity within Bayesian Analysis of Population Structure (BAPS) clusters. Analysis of the overall homogeneity within each of the defined BAPS clusters (2-10), using the Simpson diversity index, for continent, region within continent and country.

Supplementary Figure 6. Histogram distribution of homogeneity within Bayesian Analysis of Population Structure (BAPS) clusters. Distribution of the homogeneity within each of the defined BAPS clusters (2-10), using the Simpson diversity index, for continent, region within continent and country.

Supplementary Figure 7. Global *S. Typhi* tree showing the final genotype structure (primary clusters, clades and subclades) and raw BAPS clusters.

Tree shows maximum likelihood tree of 1,831 *S. Typhi* as in **Figure 1**. Branches are colored by clade. Colored rings indicate: (1) Primary clusters (as labeled); (2) Clades (as labeled); (3) Subclades (alternating colors within clades); (4) BAPS level 3 clusters (randomly assigned colors); and (5) BAPS level 6 clusters (randomly assigned colors).

Supplementary Data 1. Isolates used in this study (see excel file)
