

Addiction's policy on preprints

Robert West

A preprint is a manuscript that has been posted on a public platform, such as Qeios, arXiv, SocArXiv, PsyArXiv, or SSRN, before it has been peer reviewed. Like other major medical and scientific journals, *Addiction* does not regard posting an article on a preprint platform as prior publication. Articles that have been posted to a preprint platform may be submitted to *Addiction* for review and publication under the following conditions:

- There is a clear statement in the *manuscript submitted to Addiction* that a preprint of the article has been posted, including a live URL to that preprint and a full history of the manuscript up to submission to *Addiction*. This applies even if the preprint link is to a previous version that was rejected by another journal. A standard form of words that will make it easy to find this statement is 'A preprint of this article has been posted at [URL],' followed by a history of the manuscript. If more than one preprint has been posted (e.g. because of rejection of an article by another journal), *all URLs should be included*.
- It is clear within the title or rubric of *the preprint* that it is a preprint so that it is not confused with a peer-reviewed article when downloaded or taken out of context.
- Dissemination of the preprint by any channel, including social media, should make clear that the paper being circulated is a preprint and has not been subject to peer review. *Addiction* will not consider for publication, and will halt the review process, if it discovers that this principle has not been adhered to.
- If the article is accepted for publication:
 - the peer-reviewed version published in *Addiction* must contain the statement 'A preprint of this article before peer review by *Addiction* can be found at [URL and doi]'
 - the preprint must be updated to cite the *Addiction* paper's doi in a prominent place.

Addiction has teamed up with Qeios (qeios.com) to facilitate the most effective and efficient use of preprints because this platform provides an easy way for people to review or comment on the preprint and to update preprints while maintaining an archive of previous versions. Most importantly it offers a simple way of ensuring that terms used in the article are linked to definitions, which aligns with *Addiction's* drive to improving the clarity of scientific writing [1,2]. Authors are advised not to use pre-print servers for specific journals because of the complications that arise if the journal rejects the article.

This article has been accepted for publication and undergone full peer review but has not been through the copyediting, typesetting, pagination and proofreading process which may lead to differences between this version and the Version of Record. Please cite this article as doi: 10.1111/add.15063
