

Variables (General clinical)	Finding through Delphi	Strength
Time of diagnosis of EMAS	In the majority of patients EMAS is suspected by 6-12 months after first afebrile seizure	Strong
Clinical presentation		
Age at onset	EMAS is highly unlikely when age at first afebrile seizure is < 1 or > 6 years	Strong
Sex predisposition	Boys are more commonly affected than girls	Modest
Preceding development	<ul style="list-style-type: none"> <li>• 25-30% patients have mild developmental delay preceding first afebrile seizure</li> <li>• Preceding moderate to severe delay is highly unlikely</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• Strong</li> </ul>
Prior febrile seizures	Less than half of patients have a history of febrile seizures	Strong
Family history	<ul style="list-style-type: none"> <li>• A family history of febrile seizures is found in less than one quarter of cases</li> <li>• A family history of epilepsy is found in less than half of cases</li> </ul>	<ul style="list-style-type: none"> <li>• Modest</li> <li>• Modest</li> </ul>
<b>Seizure types</b>		
Myoclonic atonic seizures	<ul style="list-style-type: none"> <li>• Myoclonic atonic seizures are mandatory for diagnosis</li> <li>• Myoclonic atonic seizures usually appear in the first year after seizure onset</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• Strong</li> </ul>
Myoclonic seizures	<ul style="list-style-type: none"> <li>• Myoclonic seizures are <b>NOT</b> mandatory for diagnosis</li> <li>• Myoclonic seizures are seen in the majority of patients</li> <li>• Myoclonic seizures usually appear in the first year after seizure onset</li> </ul>	<ul style="list-style-type: none"> <li>• No consensus</li> <li>• Strong</li> <li>• Strong</li> </ul>
Generalized tonic clonic seizures	<ul style="list-style-type: none"> <li>• Generalized tonic-clonic seizures are <b>NOT</b> mandatory for diagnosis</li> <li>• Generalized tonic-clonic seizures are seen in more than half of cases</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• No consensus</li> </ul>

	<ul style="list-style-type: none"> <li>Generalized tonic-clonic seizures usually appear within the first year after seizure onset</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> </ul>
Atypical absence seizures	<ul style="list-style-type: none"> <li>Atypical absence seizures are <b>NOT</b> mandatory for diagnosis</li> <li>Atypical absences are seen in &lt;50% of cases within the first year</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Modest</li> </ul>
Atonic seizures	<ul style="list-style-type: none"> <li>Atonic seizures are <b>NOT</b> mandatory for diagnosis</li> <li>Atonic seizures are seen in up to half of cases</li> <li>When present, atonic seizures typically begin in the first year</li> </ul>	<ul style="list-style-type: none"> <li>No consensus</li> <li>Strong</li> <li>Strong</li> </ul>
Tonic seizures	<ul style="list-style-type: none"> <li>Tonic seizures are seen in a minority of patients with EMAS</li> <li>When present, fewer than one quarter of patients have tonic seizures in the first year</li> <li>Tonic seizures do not exclude a diagnosis of EMAS</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Modest</li> <li>Strong</li> </ul>
Non convulsive status epilepticus	<ul style="list-style-type: none"> <li>NCSE is seen in &lt; 50% of cases</li> <li>When present, NCSE usually is seen in the first year after seizure onset</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Strong</li> </ul>
<b>Stormy Phase</b>		
Stormy Phase	<ul style="list-style-type: none"> <li>A stormy phase is seen in up to 50% patients</li> <li>If present, the stormy phase usually starts within the first year,</li> <li>In a minority stormy phase starts in the first 3 months after seizure onset</li> <li>The stormy phase typically lasts less than 12 months</li> <li>A stormy phase lasting &gt;18 months should suggest an alternate diagnosis</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Strong</li> <li>Strong</li> <li>Strong</li> <li>Modest</li> </ul>
<b>Development during active epilepsy period</b>		
Development	<ul style="list-style-type: none"> <li>Developmental plateauing can be seen in up to 50% patients</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Strong</li> </ul>

	<ul style="list-style-type: none"> <li>• Plateauing can occur even without the occurrence of a stormy phase</li> <li>• Developmental regression can be seen in up to 50 % of patients in association with stormy phase</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> </ul>
Hyperactivity and behavior problems	<ul style="list-style-type: none"> <li>• Hyperactivity and behavior problems can be seen in up to 25%</li> <li>• Hyperactivity and behavior problems can be seen in the absence of a stormy phase</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• Strong</li> </ul>
Ataxia	<ul style="list-style-type: none"> <li>• Ataxia may be seen unrelated to stormy phase as it may be seen due to medications</li> </ul>	<ul style="list-style-type: none"> <li>• Modest</li> </ul>
<b>Factors that would lead to reconsideration of a diagnosis of EMAS</b>		
This factor alone would lead to diagnosis reconsideration	No factors identified	NA
<p>This factor may contribute to diagnosis reconsideration but only if other atypical features were also present</p> <p>These factors would not have a significant impact on diagnosis reconsideration</p>	<ul style="list-style-type: none"> <li>• Tonic seizures and vibratory tonic seizures</li> <li>• EEG showing generalized paroxysmal fast activity</li> <li>• Age at onset &lt;2 years</li> <li>• Age at onset &gt;6 years</li> <li>• Greater number of NCSE episodes</li> <li>• Longer duration of NCSE episodes</li> <li>• Near-continuous generalized discharge on EEG</li> <li>• Slow spike-wave on EEG</li> <li>• Focal Spikes</li> <li>• Persistence of epilepsy beyond 48 months of age</li> <li>• Lack of response to the ketogenic diet</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• Modest</li> <li>• Strong</li> <li>• Strong</li> <li>• No consensus</li> <li>• No consensus</li> <li>• No consensus</li> <li>• No consensus</li> <li>• No consensus</li> <li>• No consensus</li> <li>• No consensus</li> </ul>
Reclassification to a diagnosis of LGS	Once initially diagnosed with EMAS, It is inappropriate to reclassify patients into the diagnosis of LGS because they have continued to have seizures > 48 months	<ul style="list-style-type: none"> <li>• Modest consensus</li> </ul>

<b>Investigations in EMAS – at presentation</b>		
EEG	An EEG should be performed at baseline	<ul style="list-style-type: none"> <li>• Strong</li> </ul>
Prolonged video EEG	<ul style="list-style-type: none"> <li>• A prolonged VEEG should be performed to capture and confirm different seizure types</li> <li>• A prolonged VEEG should be performed to exclude features of LGS, if the diagnosis is in question</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• Strong</li> </ul>
Neuroimaging	<ul style="list-style-type: none"> <li>• An MRI should be performed at baseline</li> <li>• PET is not indicated</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• Strong</li> </ul>
Testing for GLUT1DS	<ul style="list-style-type: none"> <li>• GLUT1DS should be ruled out in all patients</li> <li>• An LP should be pursued if SLC2A1 gene testing is negative</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• No consensus</li> </ul>
Metabolic	A basic metabolic panel including serum amino acids, urine organic acids, lactate, pyruvate, chemistries should be performed	Modest
Genetic studies	<ul style="list-style-type: none"> <li>• A karyotype is not needed except in select cases due to clinical concerns</li> <li>• A chromosomal microarray is not indicated at baseline except if other clinical concerns</li> <li>• An epilepsy gene panel should be performed</li> <li>• If the epilepsy gene panel is negative, WES should be considered in patients with EMAS phenotype especially those who are drug resistant</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• Strong</li> <li>• Strong</li> <li>• Strong</li> </ul>
<b>Investigations during the course of EMAS</b>		
EEG	Routine EEG should be performed to confirm seizure freedom	Strong
Prolonged EEG	<ul style="list-style-type: none"> <li>• A prolonged VEEG should be performed to confirm seizure freedom</li> <li>• A prolonged VEEG should be performed if there is a suspicion for NCSE</li> </ul>	<ul style="list-style-type: none"> <li>• No consensus</li> <li>• Strong</li> </ul>

Genetic studies	In drug resistant cases, a chromosomal microarray and whole exome sequencing should be considered	Strong
Neuropsychological testing	<ul style="list-style-type: none"> <li>Should be obtained prior to school entry in all patients with suspected or known developmental delay</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> </ul>
Neuropsychological testing contd	<ul style="list-style-type: none"> <li>Should be obtained annually if delay is present</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> </ul>
<b>Recommended therapies</b>		
First tier medications	<ul style="list-style-type: none"> <li>Valproic acid</li> <li>Clobazam</li> <li>Clonazepam</li> <li>Levetiracetam</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Strong</li> <li>Modest</li> <li>Modest</li> </ul>
Second tier medications	Ethosuximide	Strong
Meds not either first or second tier	CBD is not first or second tier medication	Strong
Later medications	<ul style="list-style-type: none"> <li>Topiramate</li> <li>Zonisamide</li> <li>Lamotrigine</li> <li>Perampanel</li> <li>Rufinamide</li> <li>Lacosamide</li> <li>Felbamate</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Strong</li> <li>Strong</li> <li>Modest</li> <li>Modest</li> <li>No consensus</li> <li>No consensus</li> </ul>
Dietary therapy	A ketogenic diet should be considered after failure of a first line therapy	Strong
Contraindicated treatments	<p>All sodium channel blockers except lamotrigine should be avoided (lamotrigine may be useful in some cases).</p> <p>Vigabatrin should be avoided</p>	<p>Modest</p> <p>Strong</p>
<b>Treatment of stormy course</b>		
Recommended treatments	<ul style="list-style-type: none"> <li>Ketogenic diet</li> <li>Valproic acid</li> <li>Benzodiazepines</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Strong</li> <li>Strong</li> </ul>
Other medications during stormy phase	Steroids can be used in the stormy phase	Modest
<b>Role of surgical therapies</b>		
VNS	<ul style="list-style-type: none"> <li>VNS can be considered after failure of 4-5 ASM</li> </ul>	Strong

	<ul style="list-style-type: none"> <li>VNS can be considered after failure of ketogenic diet in patients who remain drug resistant for more than one year</li> </ul>	Strong
Corpus callosotomy	Corpus callosotomy should only be considered after if patients have been drug-resistant for longer than one year, have failed 4-5 ASM and the ketogenic diet, and have frequent drop seizures	Strong
<b>Remission of EMAS</b>		
EMAS remission	<ul style="list-style-type: none"> <li>Remission occurs in at least 50% of patients</li> <li>Of those who remit, the majority will remit by 24 months</li> <li>Patients who continue to have seizures 5 years after the first afebrile seizure are highly unlikely to achieve remission.</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>No consensus</li> <li>Strong</li> </ul>
<b>Long-term developmental outcomes</b>		
Development	<ul style="list-style-type: none"> <li>In patients who experience complete remission, more than 50% will be developmentally normal at follow up</li> <li>Learning disorder without ID is seen in at least 25% who attain complete remission</li> <li>Less than one quarter of patients who achieve complete remission will be left with moderate or greater intellectual disability</li> <li>Mild to moderate intellectual disability is seen in the majority of patients who do not have complete remission</li> <li>Severe intellectual disability is rare, even in those without remission</li> <li>Drug-resistant EMAS patients who do not remit have more favorable cognitive outcomes than those with Lennox-Gastaut syndrome</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>Strong</li> <li>Strong</li> <li>Strong</li> <li>Strong</li> <li>Strong</li> </ul>
<b>Prognostic factors</b>		
Seizure types	<ul style="list-style-type: none"> <li>Tonic seizures and vibratory tonic seizures are at least moderately predictive of poor seizure outcome</li> <li>Greater numbers of GTCS in the first 2 years are predictive of poorer outcome</li> </ul>	<ul style="list-style-type: none"> <li>Strong</li> <li>No consensus</li> <li>No consensus</li> </ul>

	<ul style="list-style-type: none"> <li>• High frequency of drop seizures is predictive of poorer outcome</li> </ul>	
Non convulsive status epilepticus (NCSE)	<ul style="list-style-type: none"> <li>• Longer duration of NCSE is at least moderately predictive of poor seizure outcome</li> <li>• Greater number of NCSE is at least mildly to moderately predictive of poor seizure outcome</li> </ul>	<ul style="list-style-type: none"> <li>• Modest</li> <li>• Modest</li> </ul>
EEG	<ul style="list-style-type: none"> <li>• Paroxysmal fast activity on EEG is mildly predictive of poor seizure outcome</li> <li>• Focal spikes are predictive of poorer outcome</li> <li>• Slow spike-wave discharge is predictive of poorer outcome</li> </ul>	<ul style="list-style-type: none"> <li>• Strong</li> <li>• No consensus</li> <li>• No consensus</li> </ul>
Age at onset	<ul style="list-style-type: none"> <li>• Younger (&lt;1 year) at seizure onset is predictive of poorer outcome</li> <li>• Older (&gt;6 years) age at seizure onset is predictive of poorer outcome</li> </ul>	<ul style="list-style-type: none"> <li>• Modest consensus</li> <li>• No consensus</li> </ul>
Family history	<ul style="list-style-type: none"> <li>• Family history of epilepsy is not predictive of outcome</li> </ul>	<ul style="list-style-type: none"> <li>• No consensus</li> </ul>

Sodium channel blockers asked about were phenobarbital, phenytoin, carbamazepine, Oxcarbazepine);

VNS: Vagus nerve stimulator; ASM: anti-seizure medication
