Planning in Turbulent Times: Exploring Planners’ Agency in Jerusalem

Abstract: This paper explores the role of planning in the deeply divided and politically polarized context of Jerusalem. The overall argument developed throughout the paper is that the “planning/politics nexus” is a non-hierarchical set of interactions, negotiated within a specific historical, geographical, legal and cultural contexts – in other words, orders don’t come down from the politicians to be slavishly followed by planners. In this respect, our findings, based on in-depth interviews with Israeli planners, suggest that the case of Jerusalem represents a particularly dramatic illustration of the fact that the function of planning expertise can only be understood in relation to the surrounding socio-political environment. Furthermore, contrary to conventional wisdom, planners in Jerusalem are not destined to either complicity or irrelevance in the face of political imperatives; planners’ agency, however, does not simply reflect their mastery of a specific set professional knowledge and tools but also their ability to act strategically in relation to the context in which they operate.

Keywords: Planning conflicts; urban geopolitics; contested cities; Jerusalem;

1. Introduction

How do planners operating in a contested city make sense of the polarized environment in which the planning system functions? How do they reconcile their role as professionals with the existence of partisan policy goals and harsh power asymmetries? And to what extent can planners have an impact in such deeply polarized context – where, the argument goes, planning is subordinated to political considerations? This paper tries to answer these questions about the relation between planning and politics – what we can term the “planning/politics nexus” – through an exploration of the experience of Israeli planners in the city of Jerusalem. The overall argument developed throughout the paper is that an appreciation of the contextual nature of planning practices is crucial to further our understanding of the planning/politics nexus as a non-hierarchical set of interactions, negotiated within historical, geographical, legal and cultural contexts – and, specifically, to make sense of the agency of Israeli planners in relation to the entanglement of planning and political issues in Jerusalem.

Our study of Jerusalem offers two distinct but interrelated insights. First, it reminds us in a particularly dramatic way that urban planning issues are more broadly political and social issues. This does not only mean that planners face concerns that go beyond the narrow limits of their professional training or the responsibilities inherent to their institutional role; crucially, it also means that the function of planning expertise can only be assessed in relation to the socio-political environment in which the planning system operates. Second, we argue that, contrary to conventional wisdom, planning in Jerusalem is not destined to either complicity or irrelevance in the face of political imperatives. Planners do have agency, but any assessment of this agency depends on the acknowledgement that it is impossible to draw a neat or arbitrary boundary

between "planning" and "politics". Planners' contribution to the policy process does not simply reflect their mastery of a specific professional knowledge and set of tools, but also their ability to act strategically in relation to the context in which they operate; at the same time, there is a reciprocal influence between the dynamics of the planning process and the surrounding socio-political environment.

The bulk of the empirical material for this study is constituted by in-depth interviews with Israeli planners. The first section of the paper illustrates the theoretical background of the analysis, especially in relation to wider debates in planning theory. In the second section, we briefly introduce the reader to the environment of Jerusalem, in order to present the structural challenges to planners' actions in the context of a contested city. The third section of the paper describes the experience of planners with respect to the polarization of the urban environment, and their personal and professional strategies to cope with the challenges inherent to this situation. In the final section we offer a few concluding remarks.

2. The Power/Planning Nexus

The relation between planning and politics has been central to the debate in planning theory for decades. At least since the early 1990s, this debate has largely developed as a reaction to the success of the "communicative" or "collaborative" approaches to planning. Drawing on Jurgen Habermas' work on deliberative rationality (Habermas, 1979, 1989, 1990) and on Anthony Giddens' structuration theory (Giddens, 1984), scholars such as John Forrester, Patsy Healey and Judith Innes have focused on the mechanics of discursive and deliberative practices, and on the achievement of consensus amongst participants in order to remove imbalances and negative effects of power asymmetries in the planning process (Forester, 1982, 1988; Healey, 1992; Forester, 1993; Innes, 1995; Healey, 1996, 1997; Forester, 1999, 2009) – see Healey (2012) for a review). Their critics, in turn, have challenged the Habermasian/Giddensian roots of communicative theory by referring especially to the work of Michel Foucault (1979, 1980, 1983, 1984) and Chantal Mouffe (Mouffe, 1999, 2000, 2005).

The theory of communicative planning (itself a wide a diverse body of literature) has become the testing ground for debating a number of crucial issues for social sciences as a whole. Critics of communicative planning have debated the ontological foundations of (democratic) planning praxis (Bond, 2011; Gualini, 2015) as part of a wider argument on alternative conceptions of democratic politics (Flyvbjerg, 1998a; Purcell, 2008; Hilary Silver et al., 2010); models of rationality underlying different streams of planning theory and their analytical and normative goals have also been subjected to debate (Flyvbjerg, 1996, 1998b; Flyvbjerg & Richardson, 2002); as have the relations between process and context (Lauria & Whelan, 1995; Fainstein, 2000; Yiftachel & Huxley, 2000b; Fainstein, 2010) and the dialectic between analytical and normative ambitions of planning theory (Yiftachel & Huxley, 2000a, 2000c). Further critical discussions have taken place around the relation between the theoretical corpus of communicative scholarship and actual experiences of planning practices and processes (Tewdwr-Jones & Allmendinger, 1998) and the emancipatory,

progressive potential often attributed to planning practices (Flyvbjerg, 1996; Yiftachel, 1998; Porter, 2010: 125-150). And in general, the theoretical status and ambitions of the body of work of communicative scholars has been examined in the light of other approaches to planning theory, urban studies and political geography (Huxley & Yiftachel, 1998; Yiftachel & Huxley, 2000b). The debate has remained lively and, to a certain extent, polarizing, to the point that some scholars conclude that “[p]lanning theory seems to have become a set of dividing discourses” (Innes & Booher, 2014: 196). Despite some efforts to bridge the gap (Hillier, 2002; Bond, 2011), the existence of unresolved ontological, epistemological and normative tensions seem to suggest that it would be naïve to think that a comprehensive synthesis between the different positions can be found.

The debates we have alluded to, however, can serve as a background to illustrate and clarify the purposes of this paper which, first and foremost, is an attempt to offer an empirically-grounded characterization of the planning/politics nexus in Jerusalem. We maintain nevertheless, that our emphasis on the situated nature of planning practices can provide some more general insights in this respect, and suggest ways in which the gap between communicative theorists and their critics can be narrowed and, most importantly, re-interpreted in an analytically productive fashion.

Broadly speaking, it has been suggested that considering temporal and spatial context of planning intervention (and, more generally, of urban policies) can blur the differences between dichotomies in understandings of the Habermas/Foucault divide in relation to urban democracy and planning practices (Pugh, 2005; Beaumont & Loopmans, 2008; Silver et al., 2010; Bond, 2011). In particular,

distinctions between consensus and conflict, top down and bottom up, do not constitute mutually exclusive categories. [...] Rather than propose a compromise or ‘hybrid’ type of democracy [...] or simply view contestation and consensus as mutually exclusive alternatives, we see opposing normative conceptions of democracy as different ‘moments’ in the democratic process (Silver *et al.*, 2010: 454).

On the other side, since the beginning of the 1990s, social sciences have abandoned the long-held positivistic notion of expertise as neutral, rational and ready-made resource, in favour of the so-called “argumentative” turn of policy enquiry (Hoppe 1999). Also thanks to the key contributions by communicative theorists (Fischer and Forester 1993) planning professionals are today largely seen as belonging to the category that Frank Fischer defines of “post-empiricist experts”, as mediators “operating between the available analytic frameworks of social science, particular policy findings, and the differing perspectives of the public actors” (Fischer 2009: 11). At the same time, while many communicative theorists (e.g. Forester 1999, 2009; Fischer 2009) have analysed the role of experts with the aim of defining a set of good professional practices, both their critics (Flyvbjerg, 1996, 1998b) and scholars belonging to the same argumentative/deliberative tradition (Wagenaar, 2004) have pointed out that experts commonly resort to practical judgments, coalition-building, lobbying and

political activism – in short, how they make a strategic use of their professional knowledge and status to steer the policy process.

Our emphasis is on conceiving planning as a relational and non-hierarchical set of interactions and negotiations builds on these suggestions in two ways: through broad argument about the debate in planning theory; and in two propositions derived from our research on Jerusalem.

First, we suggest that in many cases the rift between communicative scholars and their critics can be productively reformulated in terms of their emphasis on two different contexts or moments in which the relation between planning and politics is played out. Communicative scholars largely focus on the “politics *in* planning” (i.e. on how issues of power, conflict play a role in the planning process) and place their emphasis (sometimes with strong normative undertones) on the role of the deliberative practitioner in this context. Their critics focus instead on the “politics *of* planning” (i.e. on the broader social and political structures in which the planning processes take place) with the ambition of developing the analytical task of examining aspects of planning policies and practices that can be seen to operate as forms of ‘socio-spatial engineering’.¹

While this distinction remains meaningful in many ways, we maintain that both dimensions are relevant to further our understanding of the relation between planning and politics. Indeed, while the critics of communicative theory have correctly noted how a purely procedural approach to planning obscures the decisive influence of the surrounding socio-political environment on the dynamics of the planning process, communicative scholars have not been totally blind to this dynamic (see for example (Healey, 2006, 2013). Healey (2003), in particular, has argued that the communicative emphasis on ethnographic accounts of planning practices can be justified in the light of the fact that “innovations are occurring all the time in the fine grain. In certain circumstances, these have the potential to challenge the driving forces to which local initiatives find themselves subject” (Healey, 2003: 109) – a position that echoes the notion of “insurgency” (Holston, 2008) and the call to learn from “marginalized” local voices to enrich planning theory and practice (Sandercock, 1998). The need to consider both the external and internal dynamics of the power/planning nexus experienced by planners in Jerusalem is critical to grasp the full complexity of their agency.

Second, we argue that Jerusalem is both an “extreme” and a “critical” case of the planning/politics nexus. It is an “extreme case” – i.e. a case that makes a point in “an especially dramatic way” (Flyvbjerg, 2006: 229) – because it emphasizes the importance of taking into account the dynamics of the local power relations in the planning process. Observing planners in Jerusalem makes clear, not only that the socio-political context constitutes a structure of constraints and opportunities for planners’ agency, but that the very definition of what constitutes “good planning practices” depends on this context. Indeed, the consensus on the very idea of “good planning practices” is more apparent than real among planners in Jerusalem; ultimately, ideals of “good planning” do not represent abstract commentaries on the role of planning but rather

¹ This tension is vividly expressed in the exchange between John Forester (2000), Patsy Healey (2000) and Oren Yiftachel and Margo Huxley (2000a), published in 2000 in the *International Journal of Urban and Regional Research*.

manifestations of specific (and not necessarily consensual) forms of contingent, limited rationality (what Flyvbjerg defines in terms of *realrationalität*, Flyvbjerg, 1996). Jerusalem also represents a “critical case” – i.e. a case intended to “achieve information that permits logical deductions of the type, “If this is (not) valid for this case, then it applies to all (no) cases” (Flyvbjerg, 2006: 307) – with respect to planners’ agency. In other words, if we are able to demonstrate that planners do have an influence on urban issues in Jerusalem – where, it is widely assumed, planning is subordinated to politics – then this holds true, *a fortiori*, for less polarized urban contexts. Having said that Jerusalem contains extreme power dynamics with the potential, of theoretically linking diverging planning discourses, we now move on to how the geopolitical reality has shaped planning in the city.

3. Jerusalem – planning and urban geopolitics in a contested city

The partisan nature of planning in Jerusalem is widely recognized – and indeed, the city is firmly placed in the literature on “contested” cities (Kliot & Mansfeld, 1999; Kotek, 1999; Bollens, 2000; Anderson, 2008; Rosen & Shlay, 2010; H. Silver, 2010; Calame & Charlesworth, 2011; Rosen & Shlay, 2014) – see Allegra et al (2012) for a review. In Jerusalem, past and continuing conflicts between Israelis and Palestinians have created a situation where the very existence of the system of governance is contested by large part of the population, and where the planning system as a whole lack widespread legitimacy but instead, plays a major role in exacerbating spatial and social division. The scholarly literature has produced countless accounts of the asymmetries inherent in Israeli planning policies in the city (For some recent examples, see: Dumper 2014; Shlay & Rosen 2015). It is not our intention to list and describe the many episodes and facets of the politicization of planning in Jerusalem: however, in order to relate our exploration of planning practices to their contents, context and scale, we will attempt in this section, to understand how this extreme urban geopolitical condition created a set of opportunities and constraints for Israeli planners.

Since the reunification of the city in 1967, territorial and demographic concerns over the status of Jerusalem have been paramount in determining planning decisions. After the 1967 war, the Israeli government expanded the municipal boundaries of Jerusalem to include 71 km² of the West Bank. The new boundaries were traced following the principle “a maximum of land with a minimum of Arabs” (Benvenisti 1995: 53) – i.e. to allow the city to expand on a metropolitan scale through the annexation of vast tracts of empty land beyond the narrow (6.5 km²) limits of the Jordanian municipality of Jerusalem, while at the same time leaving outside the city limits densely-inhabited Palestinian suburbs such as Abu Dis and el-Eizariya. The expansion of the municipal boundaries represented an administrative fact on the ground intended to foreclose the possibility of a future territorial compromise being forced on Jerusalem. This also dictated the choice of the “dispersed” model of urban development favoured by the government and the Ministry of Housing, which aimed at the rapid mobilization of resources to build the so-called “new neighbourhoods” of Jerusalem on green-field sites (French Hill, Gilo, Ramot Neve Ya’akov, East Talpiot and Pisgat Ze’ev). The dispersed model was preferred to the “compact” city model, which had been advanced in the informal Master Plan

for possible future reunification of the city, drafted by municipal planners in the years before 1967 (Schweid, 1986; Faludi, 1997).

The same underlying principle (to establish a large, unified city with a dominant Jewish majority) continued to guide Israel's planning policy in the following decades, resulting not only in a marked gap between communities in terms of housing, services provision and infrastructure investments, but in a chaotic expansion of the urban fabric – indeed, no comprehensive plan for the city of Jerusalem has been legally approved since 1959. The most recent proposal for a new Outline Plan, the "Jerusalem Master Plan 2000" (JMPD, 2004), explicitly emphasized the need to maintain a Jewish majority in the city, expressed in terms of a population objective of 60% Jewish to 40% Palestinian – in itself a shift from the original, post-1967 70%-30% ratio. In order to maintain this ratio, the plan allocated a limited amount of land for the expansion of Palestinian neighbourhoods. Still, even this relatively modest increase proved to be controversial. The Master Plan 2000 was presented in an initial version in 2004, and was eventually approved for deposit in 2007. However, the Israeli Minister of Interior effectively froze the plan, claiming it discriminated against the Israeli population in favour of the Palestinian (Rokem, 2013: 9).

Consequently, as Faludi notes, Israeli planning authorities have operated in Jerusalem with a strong sense of purpose, but without adopting a formal or explicit planning doctrine (Faludi, 1997: 83). Echoing Faludi's remarks, a senior planner at JIIS (formerly Policy Director of the Jerusalem Municipality Planning Department) observes:

Jerusalem grew during the last forty years, not in a systematic way as towns are growing, gradually from one point to another; it was jumping to the edge of the boundaries of the boundaries [...]. If it was to remain to the planners, they probably would not decide to [build] in the south Gilo somewhere, but to grow [the city] gradually, step by step, towards that. [F, interview, November 2010]

In the same vein, a senior city planner of the Jewish settlement of Ma'ale Adumim (a dormitory town of about 40,000 residents located about 7 km east of the Old City of Jerusalem) comments:

I think that Jerusalem lacks a lot in planning: it does not have a general view. After 1967, the Ministry of Housing and the government tried to achieve certain political goals in Jerusalem [...]. I don't think that there was a really [much thought] about [...] how this town will function [K, interview, November 2010]

The examination of the planning system at the metropolitan scale – where the demographic weight of the Palestinian community is larger than in the municipality of Jerusalem (see Allegra 2013: 504-6) – offers an even better illustration of the distortions placed on the statutory tools for urban and regional planning. The metropolitan area of the city is by and large a functional urban region, (despite the existence of severe limitations to Palestinian freedom of movement), however, this region is effectively split in two halves in jurisdictional and administrative terms. The first is represented by the Israeli Jerusalem District and the second by the Israeli Civil Administration. The Jerusalem District is an administrative planning region including the Jerusalem municipality and the area that lies westward. Planning in this area is under the

responsibility of the Jerusalem District Planning Committee and falls under the provision of the current statutory plan for the district (TAMAM30/1, 2013) – (Figure . 1).

- INSERT HERE-

Figure 1: Greater Jerusalem Map*, reproducing the Jerusalem Regional TAMAM 30/1 Masterplan and Ma’ale Adumim Masterplan.

Much of the functional region of the city, however, lies outside the Jerusalem District boundaries on the east side of the 1967 “Green Line”. The area lying north, east and west of the municipality of Jerusalem is placed under the supervision of the Civil Administration, a division of the Israeli Ministry of Defence in charge of the administration of the West Bank. Its planning system functions on the basis of the pre-1967 Jordanian law, as amended by the orders of the Israeli military authorities. In this area we find a number of Palestinian and Jewish communities, including a few relatively large urban centres such as Ramallah, Bethlehem, Givat Ze’ev and Ma’ale Adumim. Further elements contributed over time to the fragmentation and the stratification of the planning system including in particular the implementation of the Oslo agreements which introduced at least four main different governance models operating on an archipelago of separate administrative areas in the West Bank); and the construction of the so-called “separation barrier” started in 2003.

The areas of the West Bank under the authority of the Israeli Civil Administration enjoy a differentiated degree of informal integration into the Israeli planning system. Planning schemes for large Jewish settlements such as Ma’ale Adumim are largely – albeit informally – part of a metropolitan understanding of a Jewish “Greater Jerusalem”. Planning documents, such as for example, the 2006 Ma’ale Adumim regional Master Plan (Figure. 1), make it clear that Israeli planning for the actual Jerusalem functional region is not limited to the territorial scope of Jerusalem District plans such as the TAMAM 30/1.

This fundamental ambiguity is implicitly acknowledged by the recent emergence of planning concepts that seek to operationalize the political notion of “Greater Jerusalem”. Since 2009, for example, the Jerusalem Institute for Israel Studies (the quasi-official municipal research institute on planning issues in Jerusalem) has added to its yearly *Jerusalem Statistical Yearbook* a section presenting data on the so-called “Jerusalem Region”, which includes the municipality of Jerusalem and its Jewish hinterland on both sides of the “Green Line”, while at the same time excluding Palestinian localities in the West Bank (Choshen & Korach, 2014: 95; JIIS, 2014). As one of the Institute planners remarked, JIIS consciously decided not to publish data on the Palestinian population in the metropolitan area [J, interview, February 2010].

The constraints placed by political imperatives on the development of the urban fabric are most evident in the field of housing policies – a critical policy sector for the maintenance of an “appropriate” demographic balance between the two communities. Distortions in data collection such as those underlying the concept of a “Jerusalem Region” reflect Israeli concerns for the ‘worsening’ demographic balance with the Palestinian population both within and outside the municipal boundaries of the city. At the end of 2013, the population of the

municipality of Jerusalem numbered 829,900. The Jewish population was 509,600 (61.4%), while there were 320,300 non-Jewish residents (38.6%) (CBS, 2013). By not considering Palestinian localities in the West Bank, the JIIS' Jerusalem Region incorporates an additional 495,000 Jewish residents, but only 6,500 Palestinians (i.e. the residents of Abu Gosh, an Arab Israeli village located 10 km west of Jerusalem). This is clearly an optical illusion: estimates roughly based on the territorial notion of a Jerusalem Region showed that when Palestinian localities are included, the population of the area is about two million people (with a slight majority of Palestinian residents) (Allegra, 2013: 504-506), distributed along two axis crossing in Jerusalem – what Noam Shoval (Shoval, 2007: 96) calls the “Metropolitan X”: a Palestinian north-south axis stretching from Ramallah to Bethlehem, and an Israeli east-west axis stretching between Ma’ale Adumim and Modi’in. Our analysis has presented so far the multifaceted geopolitical constraints; in next sections we will focus on how the planners deals with the implication of working within such a complex reality.

4. Planning in turbulent times

In this section we discuss Israeli planners' perception of the planning/politics nexus and their strategies and agency in relation to urban issues. A few considerations are in order before going further. Our discussion is mainly based on interviews realized with Israeli and Palestinian planners between 2010 and 2013. While our original focus was on substantive urban issues, our engagement with our respondents and the empirical material has pushed us to explore the subjectivity and the agency of planners themselves. Methodologically, the organization of fieldwork and interpretation of the data followed the same inductive pattern, through coding, memo writing and theoretical sampling.

The discussion presented in this paper is based on selected interviews with Israeli planners (including two Palestinians with Israeli nationality); we decided to focus on Israeli planners because in Jerusalem substantial constraints are placed on the participation of non-Israelis (i.e. on Palestinian planners without Israeli nationality) in the planning process and on political mobilization in general. In consideration of this fact – and of the limited space available to develop our analysis – we chose to discuss a restricted but more homogeneous group of respondents. Our respondents work(ed) either in municipal and governmental administrative offices and bodies, or in human rights-oriented NGOs (such as Bimkom, Peace Now, BT’selem, Ir Amim, and others – see Appendix).

To frame our discussion, we will refer to these two categories as “mainstream” and “activist” planners respectively. Even in the polarized environment of Jerusalem, however, the two categories cannot be neatly separated: “mainstream” planners sometimes become stern critics of the same policies they have contributed to implementing, or they refrain from making career choices that would require them to work in specific areas or fields. Similarly, “activist” planners work in West Jerusalem with the same municipal officers whose policies in East Jerusalem they criticize. And in each case, criticism (and endorsement) of Israeli official policies varies in degree and nature. Retrospectively, however, we found that this distinction tends to reflect

the existence of different narratives about planning developed by the two groups.

The impact of politics on urban planning issues

How do planners in Jerusalem see the planning/politics nexus? On the surface, a rather striking unanimity seems to characterize the local planning community. Jerusalemite planners seem to be perfectly conscious of the deep politicization of urban issues; everyone can mention episodes in which planners have “lost” the battle to politicians, or in which the lack of proper planning and the distortions of statutory and developmental tools negatively affected the local community.

The professionals working in the various branches of Israeli administration – who we have called “mainstream” planners – are almost unanimous in lamenting the absence in Jerusalem of what Faludi (1997) would consider an explicit “planning doctrine”. After 1967, crucial decisions on the future development of the city were “imposed on the planners to handle [...] The major decisions are political decisions and the planners have to cope with it” [F, interview, November 2010]. This is further reflected in an interview with the current Director of the Jerusalem Municipality Planning Department voicing his opinion about the option of promoting plans in Jerusalem’s Palestinian areas; “[w]hat are my chances of moving the plan forward in the current Municipality? [...] not great”: because of the “lack of political interest” on the part of the municipality [A, interview, May 2013]. Activist planners know only too well the difficulties inherent in attempting to plan in Palestinian neighbourhoods, and they certainly agree about the impact of the entrenched politicization of the planning system. Indeed, a large part of the activity of organizations such as Bimkom, Peace Now, BT’selem, and Ir Amim consists of denouncing the distortions of local planning policies and in monitoring their (negative) results on the local community (see e.g. (Cohen-Bar & Kronish, 2013; El-Atrash, 2015).

Similarly, on the surface planners seem to share the idea that the adherence to set of “good planning practices” constitutes an essential requirement for implementing meaningful and effective planning intervention in the city. NGOs involved in planning initiatives seem to invariably adopt participative and deliberative practices in their *modus operandi* (Bimkom, 2006; Rokem et al., 2009; El-Atrash, 2015), but even mainstream planning institutions seem to have adopted the now-standard references to participatory practices, multi-disciplinarity and multiculturalism as the base for a comprehensive approach to urban issues and the creation of a positive relations with the stakeholders in general. This is reflected for example in the passage, quoted by a study conducted by the JIIS in 2010 on the Kidron Valley (a North-South strip separating the Old City from the Mount of Olives):

a strong emphasis was placed on involving [Palestinian] residents of the area the process. The researchers met with representatives of the residents of all the neighborhoods included in the research area [...]. The multidisciplinary team included researchers and planners from numerous fields, including Arab researchers who are thoroughly familiar with the area. We owe the latter particular thanks for enabling the entire team to gain a closer acquaintance with the living conditions and physical state of the neighborhoods [...]. (Kimhi, 2010)

Such unanimity, however, is more apparent than real. If all the planners in Jerusalem concur on the politicization of planning, their interpretations of the planning/politics nexus diverge radically, largely reflecting a “mainstream”/“activist” divide. Mainstream planners tend to see the relation between planning and politics in antagonistic terms: political obstacles constitute a burden imposed by the conflict as a whole on the metropolitan area – and on their efforts as professionals. Indeed, many planners seem to believe that a structural incompatibility exists between planning and politics. By creating balanced development schemes, planning would irremediably conflict with the political process by setting preconditions to the negotiations [N, interview, November 2010; see also Bollens, 2000: 153-4]. The ubiquitous politicization of urban issues would therefore represent the antithesis of the positive atmosphere required for productive planning discussions. As a senior planner in the Jerusalem municipality notes, in explaining the lack of development in Palestinian areas,

When you negotiate with the Arab sector there is a clear difference in perception and it's much harder to reach a solution [...]. [T]hey don't agree even when you reach a solution for 90 percent of the houses becoming part of the plan and another 10 percent illegally built having to be demolished. It's a 100 percent win-win solution or nothing [B, interview, June 2013].

The politics of Israeli-Palestinian conflict also creates distortions in the agenda of urban development. One of our respondents, elaborating on the “conflict between urban goals and government goals” notes how,

[e]very time a developer wants to develop something in the city center [...] [the municipality] would tell him to develop their residences [for the Jewish population]. Why? Because they want to keep the demographic balance. Residences, residence, residences... and then the city center is not functioning because every time they develop residences instead of services, arts, museums, employment, as it should be. [J, interview, February 2010].

This antagonistic understanding of the planning/politics nexus is founded on the idea that planning and political considerations are separable. Indeed, in an effort to come to terms with the partisan nature of planning policies in Jerusalem – and, sometimes, to minimize their own involvement in political controversies – many of the mainstream planners seem to adopt the strategy described by Morley and Shachar (Morley & Shachar, 1986: 45), namely, to base their activity on a discourse that emphasizes the technical and ultimately objective nature of planning knowledge and methodologies.

This strategy is enacted by creating multiple layers of professional and institutional boundaries that separate their activity from the surrounding political context, which ultimately create and maintain a “safe space” for the planner to act in conformity with his or her professional training and ethics. A first layer consists of a “psychological separation of an administrative ‘me’ from a political ‘them’” (Bollens, 2000: 109). While our respondents often spontaneously declared their political preferences – usually in a convoluted manner (e.g. “I am not known as a very right-wing - on the contrary” [F, interview, November 2010]), they did so only to immediately distance themselves from the entanglements of politics by unequivocally stating their

adherence to professional and ethical standards. Indeed, our respondents regularly emphasized their strictly professional role in the planning process: as one of them put it, “I am not a politician [...]. The attitude of this office is very professional; we are not into political issues” [E, interview, November 2010]. Some of the respondents articulated this separation by referring to the different stages of the planning process: planners begin their work after politicians have already created the set of opportunities and constraints for the former to act, so that what’s left for the planners in many cases is to make sure that political deliberations are translated on the ground in a professional way. For others, planners and politicians belong to separate species altogether –some of our respondents went so far to imply that an agreement about major planning decisions among members of the planning community would be relatively easy to reach, irrespectively of their political views or ethnic background [D, interview, November 2010].

The second layer of separation between politics and planning is provided by the methodological apparatus that makes up the planning profession: a code of conduct and a set of technical tools that would enable the avoidance of political debates on issues such as sovereignty and self-determination, democracy and human rights, and instead allow a focus on the apparently ‘non-political’ issues inherent to the daily life of individuals and communities in the city. Many planners seem to believe that, at least to a certain extent, the use of specific planning instruments – such as the “potential model” of placing infrastructures to serve both communities in areas where the potential for conflict is highest [E, F, M, interviews, November 2010; see also Bollens, 2000: 148] – would allow bypassing political issues and even have an inherent value in terms of conflict management. Reference to methodology, technical tools and professional standards is deemed to provide planners with a separate space, a space where they can deal with contentious issues as purely urban issues, and where professional expertise can be deployed in a relatively uncontroversial way. Or, to put it differently, whatever the (lamentable) political situation, the stakeholders can achieve tangible benefit from the use of the planners’ professional toolbox. A planner at JIIS expresses this concept as follows:

I am speaking about the basic urban level of services, employment, transportation. [...]. I think that the basis for a joint life does not have to include any political restructuring. [...] I think that things can advance even without any change of political framework. I know that the facts in the last forty years are against what I am saying, but I think that [there have been some advances] [J, interview, February 2010].

The logic of “incompatibility” between planning and politics enunciated by mainstream planners is turned upside down by activist planners. While they also express their frustration in confronting the urban reality of Jerusalem, they see the distortions of urban development not as the unfortunate consequence of the prevalence of political considerations, but rather the direct consequence of the partisan nature of the local planning system – from the ethno-national, demographic imperatives informing planning decisions to the collusion between politicians, government officials and the Jewish settlers. The impossibility of addressing pressing urban issues does not depend on political constraints placed on professional planning practice, but rather on the overall coherence between

1
2
3 planning and politics, and on the consensus among politicians, bureaucrats and
4 professionals about the fundamental goals and principles of urban policy [I, L,
5 interviews, February 2010; see also (Kaminker, 1997)]. Hence, the main source
6 of frustration for activist planners is not the feeling that political factors limit
7 their role as professionals: instead they perceive themselves as waging a struggle
8 against the whole planning system – a struggle in which “counter-planning”
9 activities require huge efforts but only bring about minimal results.

10
11 In a more subtle way, the ambiguous and artificial separation between
12 planning and politics is widely perceived by “activist” planners as an effective
13 rhetorical tool to avoid debating pressing urban issues and prevent the
14 submission of planning objections or filing petitions to courts:
15

16
17 The planners in the offices, they say, “This is politics, don’t talk to us here in this
18 committee about politics, we are talking about planning” [I, interview, February 2010].

19
20 I am not very optimistic about [going to courts] [...]. For example, the petition against E-1
21 [an area between the city of Jerusalem and the settlement of Ma’ale Adumim; Israeli
22 development plans for the area are widely seen by the Palestinians and international
23 community as the ultimate threat to two state solution - see Allegra (2014)] in 1998 was
24 rejected on the ground that [it was] a general petition that deals with issues that are
25 primarily political in nature. Now, you can argue this [about almost] everything in the
26 West Bank, so that’s why we actually to avoid as much as possible anything that can hit
27 on a political argumentation... But still, if they want they can always say it [G, interview,
28 February 2010].

29
30 In this context, political considerations are a crucial factor for the
31 evaluation of planners’ roles in Jerusalem. Mainstream planners’ arguments
32 about their effort to defend their neutrality through commitment to professional
33 standards to maintain a balanced role in dealing with urban issues is widely
34 considered by activists as an attempt at self-deception, or worse, as a rhetorical
35 device designed to hide their complicity with the system
36

37
38 Planners want to get jobs. They are part of the political system, of the power relationship
39 [...]. There are very few planners who refuse to plan in the occupied territories, most of
40 them hide behind that excuse, “We are trying to be [neutral]”. The fact that you [make]
41 that plan is political... otherwise you should refuse. If you don’t refuse, you become part
42 of the process [C, interview, November 2010].

43
44 Some of our respondents abandoned their work in the Israeli planning
45 offices at some point, precisely because of their uneasiness with the political
46 environment and the overall direction of municipal policies [C, H, interviews,
47 November 2010, February 2010]. Commenting on her past positions in the
48 planning administration, one of them concluded that she no longer felt
49 comfortable representing the municipal administration, and this motivated her
50 decision to work as a freelance, with the possibility of selecting projects that
51 harmonized with her political views [O, interview, May 2012]. Similarly, another
52 prominent figure in the Jerusalem planning establishment who had “opted out”
53 for political reasons was Sarah Kaminker (see Forester *et al.*, 2001: 115-38).
54

55
56 The same considerations on the position of the planner vis-à-vis the
57 political system are part of an ongoing debate among activist planners about the
58 possibility of “working the system”.
59
60

From the start we had an internal debate [about whether] we should actively engage in the planning process or remain an outside critical voice opposing unjust planning and violation of human rights. [...] When we actively plan, we become part of the disease and can't take a more external critical position [I, interview, July 2012].

Ultimately, the controversy surrounds the very meaning of planning practices. Contrary to the largely procedural (if sometime participative), neutral approach enunciated by mainstream planners, for activists, professional techniques and methodologies have a less straightforward role in the planning process. In the report on the *Kaminker Project* – a deliberative planning initiative carried out by the Israeli NGO Bimkom in the Palestinian neighbourhood of Isawiya – this double role is clearly enunciated: on one hand, the document states that in Jerusalem “all too often political and economic interests drive planning decisions” while “[t]he planning decisions of the Kaminker team were based [...] on objective planning criteria, namely, the needs and constraints of Issawiya residents”; on the other hand, Bimkom’s planning intervention in Isawiya had an inherent, broader political goal, aiming to serve “as a tool to foster equality and promote co-existence between Arab and Jewish populations” (Bimkom, 2006: 4).

“Good planning practices” and the contextual nature of planners’ agency

The quotes above introduce the second crucial theme of this paper. How is it possible for planners in Jerusalem to have an impact on urban issues? Do planners have any agency at all in the contested city of Jerusalem? And what is the role of the adherence to a set of “good planning practices” in this respect?

The starting point of our discussion is the conventional wisdom that in Jerusalem planning plays a largely subordinate role; in other words, planning in Jerusalem is either irrelevant (because political considerations, rather than planning arguments and models, dictate the development in the city) or purely instrumental in the face of politics (i.e. that planning is simply “war carried out by other means”: (Coon, 1992: 210) – the argument echoes the position of some post-colonial theorists (Porter, 2010) which consider planning as inherently geared toward the exclusion and dispossession of the colonized. It is certainly not our intention to deny the partisan nature of the planning interventions that have marked Jerusalem’s urban development under Israeli rule in the last decades: the growth of the city and the structure of the planning system have been profoundly affected by the lack of representation of Palestinian population and the partisan nature of Israeli policies. From this point of view, the case of Jerusalem has often been cited to support the view that “good planning practices” per se do not constitute an antidote to the status quo and can even accentuate the conflicts they are supposed to minimize – what Dumper (1997) called the “central paradox” of planning in the city (see also Bollens, 2000: 12).

Acknowledging partisanship, however, does not necessarily mean subscribing the idea that the relation between planning and politics is hierarchical. The line between planning and politics is openly and constantly blurred in Jerusalem, so that in a sense it is paradoxical to frame the relation between the two in terms of a clear-cut hierarchy. Dumper’s (1997) paradox represents a first, implicit acknowledgement of the fact that the very idea of

“good planning practices” – collecting detailed, first-hand knowledge of the urban environment, adopting sophisticated technical tools, involving the stakeholders, and so forth – should be problematized by contextualizing and historicizing our exploration of the planning process. Empirically, the impact of planners on major urban issues should not be measured against the yardstick of a planning handbook, but rather in a more holistic manner: to this purpose, planners should be considered as full-fledged actors, who participate to the policy process by virtue of their professional status, but whose role is not necessarily limited to a technical contribution.

Jerusalem offers multiple examples of how planning and political arguments might overlap, and how planners’ agency might surface in unexpected ways. To be sure, Jerusalemite planners face issues that go well beyond the narrow realm of planning and of their professional skills and training. Crucially, however, planners’ inclusion in the policy process involves instead practical judgments and a strategic use of their professional knowledge and status (Flyvbjerg, 1998b; Wagenaar, 2004) in the planning process itself. As David Best (one of the main planners working in East Jerusalem after 1967) notes, working as a planner does not simply entail the mobilization of technical knowledge, but rather the display of a wider range of skills including lobbying, creating and maintaining access to influential individuals and institutions, manipulating clients and public opinion. (Forester et al., 2001: 57-64). In Best’s words, the planner should “try to get people to believe that they have arrived at conclusions which they feel is right [...]. It’s a question of psychology, backed up by a lot of information and knowledge” (ibid, pp. 61-63). The description by Thomas Leitersdorf, the chief architect of the team in charge to plan Ma’ale Adumim, of the meeting during which the final location of the settlement was chosen, offers the occasion to reflect on these dynamics.

When we put the alternatives to the Ministerial Committee for Settlement, [the body charged with the approval of the establishment of new settlements] headed at the time by Ariel Sharon, the only questions asked were: “Which of the alternative locations has better control over the main routes?” And ‘which town has a better chance to grow quickly and offer qualities that would make it competitive with Jerusalem?’ I replied that according to these criteria the ideal location would be location A [the present site of Ma’ale Adumim] [...]. At that moment Sharon rose and declared, without consulting the Committee, that “the State of Israel decides on location A” (Tamir-Tawil, 2003: 153-154).

On the surface, this vignette seems to a straightforward case of top-down, politico-strategic decision-making. The notorious “hawk”, the Likud member Ariel Sharon (who later on served as prime minister of Israel) is apparently the only relevant player on the scene: the planner’s subordinate position is clear as he limits himself to answer the politician’s specific questions – the rest of the committee is simply silent. However, if we dig under this surface, the picture reveals a hidden complexity. First, the (four) locations on which Sharon was asking the planner’s opinion had been previously selected by another planning team more than a year before, during the last months of Yitzhak Rabin’s first tenure as prime minister – Sharon himself therefore acted, at least to a certain extent, within the boundaries determined by planners. Second, interviews with members of the Ma’ale Adumim planning team reveals that they wanted to change the location of the settlement to location A *before* the meeting of the

Committee [D, H, interviews, November 2010, February 2010; see also Tamir-Tawil, 2003: 153]. This means that Sharon, by interrogating planners' (supposedly) neutral expertise, ended up choosing the location that the planners had already selected as the best possible option. What is important here is not so much the planner' motivations for choosing location A, or the possible conflicts between the politician and the planner, but rather the appreciation of the fact that the decision-making landscape is significantly more blurred than a superficial understanding of the planning/politics nexus would assume – and that planners, like any other actor, can exert their influence on the planning process by strategically interpreting the dynamics of decision-making.

To relate to the distinction introduced earlier between “politics *in* planning” and “politics *of* planning”, planners operate both as “post-empiricist experts” (Fischer, 2009) contributing to the policy process through their mastery of technical knowledge and their ability as mediators, and as agents of political mobilization in the broader context of a given urban reality. Mainstream planners might wish for an environment where their professional lives are made easier by the relaxation of political tensions, and where urban issues are treated following planning handbooks more closely. This does not mean, however, that planning and political arguments are invariably at war. As one of our respondents notes, technical arguments could be mobilized in support of the construction of suburban settlements like Ma’ale Adumim, alleviating the demographic pressure on the overcrowded city of Jerusalem [H, interview, February 2010]. Furthermore, planners do have political worldviews, which sometime harmonize with decisions taken by politicians; this is the case, for example, of the period immediately following the reunification of Jerusalem – in Israel Kimhi’s words, “a glorious time” for Israeli planners (Bollens, 2000: 109) given the once in a lifetime opportunity of re-configuring Jerusalem’ from a split city into one urban core.

The case of activist planners offers us yet another example in this respect. As two Israeli researchers observe in their study of Bimkom’s deliberative planning initiative in Isawiya, “Had we chosen to measure Bimkom’s planning process against any ideal model of deliberative planning, we would have to deem it a failure” (Ron & Cohen-Blankshtain, 2011: 646), because of the political limitations inherent in the development of the process and, ultimately, the impossibility of getting any plan approved by hostile local planning commissions. Still, precisely because the chances achieving tangible results through the planning system remain very low, political mobilization becomes the ultimate goal of planning practices. Deliberative planning practice can be understood “as a form of political representation that competes with other forms of representation” (Ron and Cohen-Blankshtain, 2011: 637). As an architect and planner working for Bimkom notes with respect to a petition against house demolitions in Palestinian neighbourhoods, “We don’t believe that our petition [...] will stop demolitions, but we want to raise awareness” [I, interview, February 2010]. It might well be true, as Alfasi (2003) and Martens (2005) have argued in relation to the Israeli case, that participatory practices do not necessarily make the planning process more democratic if more structural reforms of the planning system are not implemented. However, the practices of activist planners also function quite clearly as a vehicle for addressing urban issues in a broader, holistic way (Yacobi, 2007).

As such, activists' deliberative planning practices (although partial and most likely doomed to failure) hold value in their promotion of a more democratic approach to planning even in such contested cities as Jerusalem (El-Atrash, 2015: 50). In this respect, the case of Jerusalem is also instructive to the extent that it shows that planning initiatives can sometimes have an impact in their challenges to dominant approaches. First, and most obviously, from time to time plans initiated by activist planners or Palestinian residents unexpectedly make it through the Israeli planning commissions. The case studies examined in the recently released UN-Habitat report on Jerusalem (El-Atrash, 2015) presents some examples in this respect. Even more surprising has been the recent approval by the Jerusalem District Planning and Building Committee of a plan for the construction of 2,500 housing units in the Palestinian neighbourhood of Jabal Mukaber, initiated by Israeli Palestinian architect Senan Abdelqader on behalf of the residents (Hasson, 2015). Needless to say, many doubts remain about the future implementation of this project. Also, a more detailed analysis of the plan would be needed to assess how many of the 2,500 planned housing units represent new construction, rather than the ex-post approval of existing buildings.

Second, individual, uncoordinated planning initiatives can incrementally create the conditions for broader political changes. As Braier (2013) has argued in her study of Jabal Mukaber, where several NGOs have been especially active in the last fifteen years, independent zoning plans submitted by Palestinians to Israeli commissions represent a form of "quiet encroachment" (Bayat, 2013) – or, as James Holston (2008) would put it, "insurgent planning" – see also Sandercock (1998). In other words, these initiatives – small-scale plans submitted by individual residents in order to protect their properties from the threat of demolition or to allow for small improvements – are not born out of a political opposition to the system nor do they offer a comprehensive planning alternative to major urban issues; nevertheless, the cumulative nature of these efforts constitutes an inherent challenge to Israeli sovereignty as expressed in local planning policies.

5. Conclusion

As far as the relation between planning and politics is concerned, Jerusalem represents a rather exceptional case study. However, we argue that the examination of such an extraordinary case study can offer some suggestions on how to conceptualize the relation between planning, conflicts, and power. At the same time, it makes the case for a more nuanced, and non-hierarchical understanding of the planning/politics nexus.

In the first place, Jerusalem offers a stark reminder of how urban and planning issues are more broadly political and social issues – it represents an "extreme case" in this respect. This is where communicative scholars' emphasis on planning as a set of procedures to deal with politics (or with "politics *in* planning") falls short of connecting the internal dynamics of the planning process with broader socio-political realities (the "politics *of* planning"). This is also the case for any other procedural definition of "good planning practices", irrespective of whether "good" is understood in terms of planning possessing

inherently progressive potential in delivering rational/efficient solutions, or in a more democratic/participative fashion.

The problem is not only that, in Jerusalem, mediators who “stand in connection to all sides for justice’s sake”, (Forester, 2009: 5) or power-savvy deliberative practitioners (Forester, 1999) cannot be found anywhere because of the polarized atmosphere of the city, but rather that the planners’ agency can only be assessed in relation to the socio-political environment in which they operate. It is in this respect that Jerusalem represents a “critical case”. The acknowledgement of the deep politicization of planning issues in Jerusalem does not simply restrict the role of planners either to irrelevance or complicity: rather, it offers us the appropriate yardstick for assessing their agency. Planners’ agency should not be judged simply by “how much planning” they can inject into urban development, but by their more general contribution to the policy process. The case of Jerusalem, demonstrates that even in such a polarized environment, planners’ agency can surface in many different ways, inside and outside the institutional boundaries of the planning process.

Appendix – List of interviewees

- A - Director, Jerusalem Municipality Planning Department, Jerusalem, May 2013.
- B - Senior urban planner, Jerusalem Municipality Planning Department, Jerusalem, June 2013.
- C - Former Deputy Mayor (East Jerusalem portfolio), Jerusalem, November 2010.
- D - Chief Architect, Ma’ale Adumim Planning Team, Tel Aviv, November 2010.
- E - Head, Jerusalem District Office - Ministry of Housing, Jerusalem, November 2010.
- F - Senior Researcher, Jerusalem Institute for Israeli Studies and Former Jerusalem Municipality City Planner, Jerusalem, November 2010.
- G - Researcher, Bimkom, Tel Aviv, February 2010
- H - Former City Engineer Jerusalem and current activist planner, Tel Aviv, February 2010.
- I - Planner, Bimkom, Jerusalem, February 2010 and July 2012.
- J - Planner, Jerusalem Institute for Israeli Studies, Jerusalem, February 2010.
- K - City Engineer, Ma’ale Adumim, Ma’ale Adumim, November 2010.
- L - Planner, Bimkom, Jerusalem, February 2010.
- M - Head, Program Implementation Department – Ministry of Housing, Jerusalem, November 2011.
- N - Planner, IPCC, Jerusalem, November 2010.
- O - Planner, private consultant, Former Deputy Director General for the Israel Government Tourist Corporation and Director of Planning Department at the Jerusalem Municipality, Jerusalem, May 2012.
